This event was at 25 live birds, \$12.50 entrance, including birds; \$50 added to the purse by the Federation of Gun Clubs of Kansas City; gold medal valued at \$100 presented to the winner by Mr. F. W. Meyer.

When not one of the 41 entries in this event could manage to make a straight, the birds must have been of a good quality. Seven men tied with 24 each and shot off for the medal and first place. Gottlieb beat his opponents out by scoring 20 straight in the shoot-off; others dropped out in order as named below: Sergeant, Schrader, Wills, Jim Porter, Orr and Halliwell. Gottlieb shot a Smith gun, Smokeless shell and S. S. powder. Scores:

Gottlieb, Sergeant, Jim Porter, Schrader, Halliwell, Mills and Orr, 24; Cosby, Whittier, Durkee, Garner, Hickman, Baldwin, Lee Porter, Wilson, Peck, Kelly and Swinney, 23; Walden, Dave Elliott, Norton, Horton, Wilmot, Stockwell, Underwood and Dr. Jackson, 22; Guinotte, Riley, Gordon and Overly, 21; Curtice and McDonald, 20; Frost, F. J. Smith, Ferguson and Stewart, 19; Sherman, 14; McCurdy, 13. Thompson, Potts and Jarrett retired at the end of the 15th round, having scored respectively 12, 10 and 9.

On the shoot-off in a series of 5 birds, Sergeant missed his 2d bird, Schrader and Mills each dropped out in the 4th round, Porter in the 5th, and Orr in the 6th. Halliwell and Gottlieb had a hard struggle, Halliwell killing 15 straight before losing a bird; Gottlieb, running 20 straight, won as above stated.

PAUL R. LITZKE.

The Hazard Tournament.

In our report of the tournament of the Hazard Powder Co., so successfully held at Cincinnati, O., May 19-22, we gave the figures and percentages courteously furnished us by the management. It was a cause of great regret to Mr. Waddell, and also to ourselves, to find that there were some errors in those figures. On Wednesday, May 27, too late unfortunately for our issue of May 30, we received a dispatch from Mr. Waddell, asking us to make the following corrections:

FIRST DAY'S SCORES, MAY 20.

Event 3: Shattuck scored 17, making his total 133 out of 170, reducing his average from 80 to 78.2.

Event 6: Mead scored 12, giving him a total of 144, as against 132, and an average of 84.7 as against 85.

Event 9: West is credited with 13, but only scored 10, reducing his total to 130 and his percentage to 81.7.

SECOND DAY'S SCORES, MAY 21.

Event 9: Wirt scored 16, making his total 144 and reducing his average to 84.7. In the same event two other corrections must be made as follows: Norton did not shoot; his total was therefore 104 out of 150 and his average 69.3 instead of 70.5. Settles made 16 in No. 9, raising his total to 125 and his average to 73.5.

THIRD DAY'S SCORES, MAY 22.

Event 3: Woodworth scored 12 instead of 17, making his total 143, and his average 84.1 instead of 87. Goodman in this event scored 17 instead of 12, also scoring 22 instead of 17 in No. 5; his total was therefore 130 out of 170, and his average 76.4 instead of 71.1.

Event 3: Upson made 24 instead of 12; this was an important error, as the correction made him second average for the day, and also raised him in the list of Hazard prize winners. His total was 157 out of 170, and his average 92.3.

Event 5: Flick scored 22, making his total 153 out of 170, reducing his average to 90 per cent. exactly, but putting him in the list of Hazard prize winners. In Event 5 also Shattuck scored 22, also scoring 18 instead of 15 in Event 7; this gave him a total of 135 out of 170, and a percentage of 79.4 as against 75.8.

Event 6: Bush scored 12 instead of 10, making his total 145, and his average 85.2.

Event 8: Vail scored 15 instead of 13, bringing his total up to 148 and his average to a fraction over 87.

The above alterations rendered necessary a revision of the list of

HAZARD PRIZE WINNERS.

There were twenty average moneys, class shooting. The prizes were won as follows:

- 1st—Watch and \$45: Heikes, 143.
- 2d—Diamond pin and \$40: Redwing, 142.
- 3d—Diamond locket and \$35: Budd, 141.
- 4th—\$35: Young, Leroy and Gilbert, 139.
- 5th—\$30: Fulford, 136.
- 6th—\$25: Aikire, 134.
- 7th—\$20: Glover, Trimble, Dickey, Gay, Mead and Upson, 133.
- 8th—\$19: McDonald, Vail and Grimm, 132.
- 9th—\$18: Wheeler, Parmelee, Flick and Weaver, 131.
- 10th—\$17: Raymond, Loomis, Edwards and Wirt, 130.
- 11th—\$16: Kaston, Marshall, Burton, Woodworth and Shorty, 129.
- 12th—\$15: Rike, 128.
- 13th—\$14: Parker, Merrill, Powers, Legler and Bush, 127.
- 14th—\$12: West, 125.
- 15th—\$10: Battle and Shattuck, 124.
- 16th—\$10: Gambell, 123.
- 17th—\$10: Hill, 122.
- 18th—\$10: Meaders, 120.
- 19th—\$10: Porterfield, Ballard, Ward, Desmond and Goodman, 116.
- 20th—\$10: Lyons and Phelps, 114.

The company also gave fifteen cash prizes (class shooting) for

GENERAL AVERAGES.

The list we gave last week is correct until we get down to 12th place; the 12th average money of \$10 is divided between Grimm and Upson with 449 breaks each. Gay took 13th place with 446, but Flick comes ahead of Merrill with 440 breaks to his credit, Merrill taking 15th place with 438 breaks; Leroy, who was credited with dividing 15th money, being cut out of the general average prizes.

Placing Upson where he belongs in the third day's scores makes the winners of the ten average moneys for that day's programme: Gilbert 95.8, Upson 92.3, Budd, Dickey and Heikes 91.7, Flick, Glover, Redwing, Shorty and Trimble, 90.

New York Tournament in 1897.

UTICA, N. Y., May 25.—*Editor Forest and Stream:* I am in receipt of a communication from the Auburn Gun Club, in which they say: "We beg to call your attention to the fact that at the last meeting at Saratoga Auburn was promised the State shoot in '97." I am very glad to know that such is the case, and I would be even more pleased to know when and by whom it was promised. I went to Saratoga last year, as did many other delegates, prepared to support Auburn; but Auburn put in no claim and was never mentioned, so far as I know. Rome was mentioned and put in a bid for the shoot, but Buffalo had the call, and rightly too, and was selected. It would be in order for Auburn to come forward and state just who made that promise, and who has the power to promise a shoot from one year to another.

The delegates from this section of the State, as well as many other sections, are enthusiastically in favor of Rome for 1897. They favor it because it has the finest grounds on earth for a big shoot; because it is centrally located; because when it had the shoot before it gave one of the best shoots in the history of the Association; because it put up a big, strong, guaranteed programme, and finally, because it has a royal lot of good fellows, who will hustle more to make the shoot a success than to make money.

HENRY L. GATES.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

On Long Island.

NEW UTRECHT GUN CLUB.

May 23.—The attendance at to-day's shoot of the New Utrecht Gun Club was quite satisfactory. The main events on the programme were the club shoot and the E. C. Powder cup contest. The results in these events are given below. In the sweeps, 5-bird events, \$2 entrance, Noel Money carried off the honors with clean scores in each event; during the afternoon he scored 38 out of 42, one dead out of bounds. Scores:

	Club shoot.	E. C. Cup.
T W Morfey (A, 30).....	2331222112—10	1032200
C Furgueson, Jr. (A, 30).....	2132222023—9	232222222—9

The tie in Class A in the club shoot was won by George, who beat Morfey out by killing 9 out of 10 to his opponent's 8. Bennett was the winner in Class B.

In the E. C. Cup shoot George again tied on 10 straight, but Gaughen beat him on the shoot-off by killing 5 straight, George dropping his fifth bird.

The last event of the day was a \$2 miss and out. At the end of the seventh round the birds gave out; Noel Money, Furgueson, Jr., and George, each having killed their 7 birds, divided the pot. Other scores were: Jones and Gaughen 6 out of 7, Morfey 5 out of 6.

May 30.—A big day's programme was carried out to-day at the New Utrecht Gun Club's live-bird grounds at Woodlawn, L. I. C. W. George shot a 100-bird race with Count, allowing Count 2yds. handicap and 3 misses as kills. George won, scoring 83 to Count's 78, the latter's score not including his handicap allowance. The Holiday Cup contest brought out fourteen shooters; of this number five tied with 10 straight. The tie was shot off in No. 4; at the end of the 13th round Morfey and Jones were still tied for the cup on a total run of 23 straight. As several others wanted to shoot, the tie was carried over into No. 5, Morfey winning in the 5th round of that event, finishing with 29 straight. Scores:

Dr O'Brien (O).....	20	10	7	5
C Fleet (O).....	18	12	8	5
P A Hegeman (O).....	15	9	5	4

No. 1 was the club shoot, 25 targets, known angles. Class A prize

was won by M. Van Brunt, Class B by Dr. Shepard and Class C by Dr.

O'Brien. No. 2 was the Hegeman prize, 15 targets, known angles; D.

Deacon won with 15 straight. No. 3 was at 10 targets, unknown angles;

No. 4 at reversed order; No. 5 at 5 pairs.

NEW YORK GERMAN GUN CLUB.

May 20.—The regular monthly live-bird shoot of the New York German Gun Club, held this afternoon at Dexter Park, was well attended. Fred Sauter and J. P. Dannefelter tied for the club medal on straight scores of 8 birds each. The tie was shot off in the sweeps that followed. In No. 1 both men tied again on 4 out of 5; Sauter won the medal by scoring 4 to 3 in event No. 2. Scores:

The FOREST AND STREAM is put to press on Tuesdays. Correspondence intended for publication should reach us by Mondays and as much earlier as may be practicable.

Forest and Stream Water Colors

We have prepared as premiums a series of four artistic and beautiful reproductions of original water colors, painted expressly for the FOREST AND STREAM. The subjects are outdoor scenes:

Jacksnipe Coming In. "He's Got Them" (Quail Shooting). Vigilant and Valkyrie. Bass Fishing at Block Island.

The plates are for frames 14 x 19 in. They are done in twelve colors, and are rich in effect. They are furnished to old or new subscribers on the following terms:

Forest and Stream one year and the set of four pictures, \$5.
Forest and Stream 6 months and any two of the pictures, \$3.
Price of the pictures alone, \$1.50 each; \$5 for the set.

Remit by express money order or postal money order. Make orders payable to

FOREST AND STREAM PUB. CO., New York.

THE ZOÖLOGICAL GARDEN SITE.

WHEN the Managers of the Zoölogical Society applied last month to the Commissioners of the Sinking Fund for a site for the Zoölogical Garden in Bronx Park, the request was referred to a committee of three for report. Since then the daily papers have printed statements, said to have been made about this application by the Mayor and the City Chamberlain, which we presume these gentlemen never expressed.

It may very well be that neither the Mayor nor Gen. McCook knows anything in particular about zoölogical gardens, their purposes or their requirements; but it may fairly be assumed that each possesses a fair measure of that sense which is called "common," perhaps for the reason that it is so very rare. It is not likely then that these gentlemen ever talked as they are said to have done about the danger of turning over to a private corporation the portion of Bronx Park for which the Zoölogical Society asks, for of course they know that a number of the great educational institutions of similar character in this city are in the hands of private corporations, and are managed by their Trustees purely as a matter of civic pride and without hope of any personal reward other than that which comes from the approval of their own consciences and the satisfaction of benefiting their fellow citizens.

It must have occurred to the Mayor and the City Chamberlain that the city gave to the Metropolitan Museum of Art—a private corporation—a site in the Central Park, and there erected buildings in which are collected choice treasures of art, gathered from all lands, to which the public are freely admitted and which interest, instruct and elevate the public and so benefit the city.

They could hardly have forgotten that the city has given for a site to the American Museum of Natural History—a private corporation—Manhattan Square, a large and very valuable tract of land in the geographical heart of the city, and that on this it has erected and is now building magnificent edifices, in which are shown collections of the highest educational value, collections surpassed in magnitude and interest nowhere in America, except at the National Museum in Washington.

These collections are freely shown to the public, and high and low, rich and poor, go there to view and to study the works of nature gathered from sea and shore and mountain and forest in many lands. The educational work done by these collections cannot be overestimated. Persons who care nothing for reading about nature may delight in the spectacle of a group of birds or animals which reproduces nature and nature's scenes, in which the wild creatures seem to be living their daily lives. In these institutions even those who cannot read may, for the mere pleasure of looking, learn of the wonders of realms that otherwise would forever remain unknown to them.

Just as a picture will convey to the mind an impression far more clear than a written description can ever give, so the observation of specimens tells the observer,

whether he be educated or ignorant, far more than description or picture. The plan of the Zoölogical Society is to do just what is being done by the American Museum of Natural History—to show bits of nature, but of living nature. But to the great public the collections of the Society, when ready for exhibition, will be more attractive than those of the Museum. We all of us, great and small, like to see living things, things that move, and a hundred people will stand and gaze at a live animal for one that will stop to look at a stuffed one. The crowds that gather about the few cages in the Central Park on these summer days show very clearly how popular a real Zoölogical Garden, with real collections and ample space, would be with the inhabitants of this city, rich and poor.

The Zoölogical Society is by law compelled to give to the public free access to its collections on four days of each week, and in view of the very slight revenue which could be hoped for on the other three days the Society has determined to make two additional days in each week free, reserving only one day in seven when the collections shall not be open to the public, and when artists and students may work about the animals without interruption by crowds. From what we know of the character of the Managers of the Zoölogical Society it may be assumed that they have at heart only the city's good, and that it is their aim to make their Zoölogical Garden an institution as successful, as useful and as great as the American Museum of Natural History and the Metropolitan Museum of Art.

The tract of land asked for by the Zoölogical Society is in a park which is now distant from the city's center of population, and the land is as yet wild and unimproved. It is the Society's purpose to establish here collections which will attract many thousands of people to this out-of-the-way region, and this will tend to open up a quarter of the city which is now almost unknown. For six days out of the seven this portion of the park will be open and free to the public, and on these six days its attractions will be far greater than those of any other park within the limits of New York.

Since the city authorities have given land to the Metropolitan Museum of Art, to the American Museum of Natural History and to the Botanic Garden—all private corporations, but using the land assigned them for the public benefit—there seems to be no logical reason for denying the application of the Zoölogical Society, which also will use the land granted it for the public good. The site that it asks for should be given it.

WATERS FAR AND NEAR.

OUR angling columns to-day report the opening of the Canadian salmon season. Mr. Lowry sends us the story of the first Cascapedia salmon, a noble fish of forty pounds, well calculated to give pride to a fisherman even so old a hand as our correspondent. Everything promises for this season an unusually generous supply of fish, and unless the salmon has lost its game qualities, as some people contend, there is abundant sport in store for those who are fortunate enough to have the opportunity of enjoying it. Salmon fishing is now restricted to the few, rivers are limited in number and in pools. Fishing privileges are held high. An expedition for salmon involves expense of time and money to be compassed only by those who can break their business chains when the wire brings the message that the fish are in the river. Such conditions must long prevail on this continent. The enterprise of restocking rivers like the Hudson, the Connecticut and the Merrimac may well enough excite fond fancies in the breast of the fisherman, but for generations now on the stage salmon fishing in these waters can be nothing more than an iridescent dream.

In striking contrast with the reports from the camps in Canadian salmon rivers is the story, which Mr. Avis sends us, of quiet fishing on a Connecticut farm. For one fisherman who can enjoy the privilege of salmon fishing in distant waters there are thousands who could put in a day or a half day with great satisfaction on the home stream; and, as we have frequently pointed out, no problem of fish protection is of more importance from an angling standpoint than the protection of the small streams on our own farms and near to our own towns and villages.

Quite as noteworthy as the record of the forty-pound salmon from the Cascapedia is this relation of a fortunate day's fishing in a stream at home. It is deemed remarkable that in a country like Connecticut, where the waters are supposed to be for the most part barren and to give scant

reward, fish one never so faithfully, Mr. Avis could have gone home with such a string of trout to show with pride as the proof of his work on the old farm. And yet this is something which should be within the command of thousands of fishermen, if only a wiser economy had conserved the natural resources of nearby waters. It is not too much to say that if every farmer controlling land through which trout streams flow were himself a trout fisherman, the interest in the sport and in husbanding the material for it would be so widespread that the supply would be maintained in a measure generous enough not only for the owners of the streams, but for others too. The depletion of brooks and rivers has been permitted mainly by callous indifference on the part of those who might have interfered if they had cared anything about maintaining the supply. The number of anglers is constantly increasing, and interest in fishing is more general now than ever before. We believe that this means a corresponding growth of sentiment for protection. The time is coming when the resources of local trout and bass waters will be as well understood and as carefully cared for as one now protects his pasturage and his sugar bush.

AUSTIN CORBIN.

MR. AUSTIN CORBIN, the president of the Long Island R. R., and one of New York's most successful business men, died last week at his summer home at Newport, N. H. He was thrown out of his carriage by the running away of the horses, and so severely injured that he died the same day. The driver of the carriage was killed, and the other persons in the vehicle, a physician and Mr. Corbin's grandchild, were very seriously injured.

Mr. Corbin was a man of large wealth, which was chiefly acquired in successful banking and railroad enterprises. He is best known to readers of FOREST AND STREAM through his establishment of the largest and most successful game preserve on this continent. He took the greatest interest in his park at Newport, and gave much time and thought to its management and to the task of stocking it. In it are found specimens of almost all species of North American game which will endure the New Hampshire climate, and neither trouble nor expense were spared in securing desirable additions to the collection. Certain species of animals were imported from Europe, but the most interesting species found in the park are American; buffalo, moose, elk and deer.

Mr. Corbin was a man of great public spirit, and only a short time before his death had arranged to ship a portion of his herd of buffalo to New York for public exhibition in one of the large parks here. If the project thus set on foot by him shall be carried out, this herd will long continue an active reminder of Mr. Corbin's broad-mindedness and of his generosity to his fellow-citizens.

In establishing his great game preserve, Mr. Corbin set an example which has been followed on a smaller scale by many other wealthy men, and to him must be given the credit of having inaugurated in this country a plan for game preservation which we believe will be of great service to science, and without which certain species of our larger ruminants could not have escaped absolute extinction. The system is new, but it will surely grow, and as it grows will prove more and more useful. It might not yet have had any being if it had not been for the breadth of mind of Austin Corbin.

Although the artificial propagation of black bass by his methods so successfully practiced with many other fishes is impracticable, the Michigan Fish Commission has demonstrated that a system of preserved ponds may be devised for giving the fry hatched naturally such protection as to insure a large supply of young fish for transplanting. We print in full the very instructive paper on the topic read by Mr. Seymour Bower, of the Michigan Commission, before the American Fisheries Society, and we trust that the success therein detailed may prompt other commissions to adopt the methods so well described.

The proposition recently put forward in these pages that the salmon is losing its game qualities falls properly into the classification "important if true." There are some who adduce reasons for the claim. They say that the fish of late seasons failed to show the mettle and dash of the storied salmon of a less degenerate age—all of which is extremely alarming, if there is anything in it; and we would like to hear from some of the fishermen who are on the streams this season.

The Sportsman Tourist.

IN JACKSON'S HOLE.

In Four Parts—Part One.

TO INTRODUCE the members of our party only a few lines are necessary. Sam Wester, Frank Gardenhire, A. B. Wingfield (the writer of this) and Will Johnson all hail from Tennessee; Bob Cooke, Mr. Ellsworth and his two sons live in Idaho, and Will McKamy lives in Texas. Bob Cooke was a former resident of our town and moved to Idaho several years ago, and it is due to his energies and glorious representations of the West that the party was formed for the trip. All of the party are great lovers of gun and rod. We were all thoroughly equipped, each having a Winchester express rifle, 500 rounds of cartridges each, and plenty of bedding and camp equipments, including tents, tarpaulins, saddles and bridles, etc.

On Monday morning, Aug. 15, Wester, Gardenhire, McKamy, Johnson and I arrived at Beaver Cañon, on the Butte branch of the Union Pacific Railroad. Here we hired a wagon to haul us four miles from Beaver Cañon to a creek, where we camped. We were anxious to get into camp in order to stop our expenses. Here we were found a few days later by Bob Cooke and Rev. David McReynolds, from Boise City, who had driven across the plains 300 miles. They had a new jolt wagon and a good spring wagon with seats for six, two pairs of large wagon horses, a small sheet iron stove, weight 20lbs., and the rest of our camp outfit, all of which had been purchased in Boise City. Will Johnson, our teamster and cook, was a big, square-built young fellow, who had been raised in the mountains of east Tennessee.

While in camp No. 1 our boys killed a dozen mountain grouse and caught a nice string of trout. On Aug. 18 we moved twenty-five miles to Indian Springs, where we found Mr. Ellsworth and his two sons in camp. Here we prepared for a two days' hunt in the Bitter Root Mountains. Indian Springs is near the foothills of the mountains, and we could plainly see snow upon the rugged peaks of the Black Mountain chain that rose abruptly before us. After two pack horses had been loaded with tents, blankets, cooking utensils and provisions for two days, and all our saddle horses were in readiness, we rode toward the mountains. Mr. Ellsworth was the guide, as he had been in the locality before, so he took the lead. Our route took us up one of the big cañons, and we climbed and worked our way slowly through the dense thickets of quaking asp and alder bushes. The wild huckleberry and gooseberry and currant bushes were so thick that we had often to stop and cut our way through. About dark we arrived at a place where a mountain creek dashed down through an endless succession of cañons and gorges well up toward the top of the range. Here we camped and prepared a good supper, which was very acceptable to all, after the fatigue of climbing and breaking brush. We tethered our horses and they filled themselves on the rank grass which bordered the stream.

Next morning by daylight all were up and ready for the hunt. The first thing we saw after emerging from our tent was a large cinnamon bear walking slowly up the side of a bluff on the opposite side of the cañon. He was a big one and did not seem to be at all uneasy. He had probably been down examining our camp and had moved off when the men began to stir. He was over 1,000yds. from us and so out of range. After breakfast we divided into pairs and started to find game. Sam Wester and I went together, Dr. McReynolds and Frank Gardenhire and Bob Cooke and Mr. Ellsworth were the other pairs. Sam and I hunted hard for four or five hours, but could not scare up even a deer. We saw plenty of bear and elk sign and found more than a dozen beds where elk and deer had lain all night, but we were new hunters of Rocky Mountain game and did not know their habits. We returned to camp about 10 o'clock and found all the other boys there.

Bob Cooke and Mr. Ellsworth had each killed an elk. Dr. McReynolds was laughing at Frank Gardenhire about the big bear Frank had killed. Dr. Mack said that he and Frank got into a very dense thicket of wild huckleberry and currant bushes, and were pushing and half crawling along and had gotten separated some 50yds. from each other; he could not see Frank, but could hear him. All at once Frank gave a yell like an Indian, and called for Dr. Mack to come quick, as there was a tremendous grizzly bear in the thicket just ahead of him. Dr. Mack started to go to Frank, but Frank commenced shooting his Winchester at the rate of about two to the second, and as the bullets were clipping the bushes all around Dr. Mack he very sensibly lay down behind a rock. Finally the magazine was emptied, and Dr. Mack sprang to his feet and rushed to Frank's assistance, expecting to see either a dead grizzly or a dead man. When he reached Frank's side he was standing over the carcass of a badger, and told Dr. Mack that the bear was not as big as he at first thought he was; but it was a pretty good sized cub. Frank said that Dr. Mack had exaggerated his exploit, but as Dr. Mack is a preacher, and Frank acknowledged that he emptied his magazine and called to Dr. Mack to come to him, we of course had to accept Dr. Mack's version of the affair.

After lunch we took three horses and the pack saddles and went after the two elk. After an hour or two of climbing and winding around through gorges and over masses of rock and fallen timber we arrived at the place. It was a wild and rugged country in the heart of the mountains, and considerable labor and skill were required to get the horses to the two carcasses. We found both elk to be full-sized animals, and the bull was a very large one with a magnificent set of horns. We took all the meat we could pack on the three horses, and left the hides, horns and front quarters. We were after meat to run us while on the trip through Yellowstone Park, and counted on getting plenty of specimens of horns later. We arrived at camp about dark, and after a good supper and an hour spent around the camp-fire in joking and story telling, we retired and did not need any persuasion to sleep.

Next morning we pulled up our tents and packed our outfit on our saddle horses and started back to Indian Springs, our main camp. We had to go slow, as most of us were on foot and had to lead our loaded horses. We jumped a band of elk before we got out of the mountains, and Frank and Bob Cooke both got scratch shots at them, but did not do any damage. We were very much elated over the result of our first hunt, and all agreed that the

big hunting tales we had been told by the residents of that region were not myths by any means. We had only been out two days and had killed two large elk and had seen one cinnamon bear and a drove of elk on our return trip, and Frank had murdered a cub, as he called his badger. So we knew the mountains abounded in large game, and we were happy.

At the main camp we found that they had not been idle. There was a marshy swamp, fed by the waters of the springs near camp, and the boys had found the tall grass full of wild ducks. The boys had gone duck shooting and had been out on the prairie killing sage hens. They had a pile of game that surprised us all, and had been good enough to skin and salt down several dozen sage hens and wild ducks for future use. A Western man never thinks of picking a fowl. A person who knows how to do it properly can skin and clean six while you are picking one. We tested this thoroughly before our trip was over.

Sunday we lay around camp and rested, preparatory to forced marches. We were joined by Ed Simpson, a newspaper man, and editor of the *Methodist Advocate* in Chattanooga. He is a very bright young man and a splendid comrade.

Bright and early Monday morning, with camp packed in wagons, we were on the trail toward Yellowstone Park. We traveled hard, and camped that night fifty miles from Indian Springs, on the north fork of Snake River. The plain was literally alive with prairie chickens and sage hens. Cooke was determined to make time, and would not stop every time we drove into a covey of birds. So Wester, McKamy, Frank and I, who were about the most ardent hunters in the party, took turns in riding our two saddle horses. We would gallop on ahead of the wagons two or three miles, and then kill birds until the wagons came up with us. We certainly did slaughter them. That kind of hunting was a novelty to us—to be able to find more birds than we could shoot at. By night we had a pile of them, and we all sat around the camp-fire and drew them, so they would not spoil. Bob said we were crazy to keep on killing prairie chickens when we did not need them; but we told him to hold his peace, as we had come out there 2,000 miles to hunt, and hunt we would. Then we argued that we would soon be in Yellowstone Park, where we could not fire a gun, and that thirteen hungry men would consume a big lot of game in the length of time we intended to be in the Park.

We found a man on Snake River fishing for market. He would catch his wagon bed full of fish and then haul them to Beaver Cañon and ship them to Butte, Mont., or Pocatello, Idaho, and sell them. We arrived late in the afternoon, but Dr. McReynolds, Cooke and Wester soon had their lines out, and we had trout for supper. The fishing in this country is as fine as the hunting. All the creeks and rivers abound in salmon trout, grayling, speckled mountain trout and silver-side trout. The man we found on Snake River had caught several hundred pounds, and had them in large covered baskets in the water. We exchanged birds and elk meat for a good supply, which we salted down for future use. We could catch and kill all we wanted as we traveled, but we had thirteen hungry mouths to provide for.

Tuesday morning by daylight we were on the trail again. By 9 o'clock we reached a settlement, where we left all of our heavy groceries, ammunition and extra baggage of all kinds. We were stripping for a flying trip through the Park, and as we could not hunt we disposed of all of our hunting outfit. We reached Henry Lake by noon. At Henry Lake we found a ranchman who had a high inclosure full of elk and moose. The man told us that he made a business of capturing these animals in winter when the snow was deep, and that he hauled them to the railroad and shipped them East once a year. He said he made a good deal of money at it, and I should think he would, as he must have had thirty or forty in his pen. He fed them on the native wild hay that grows abundantly on the plains.

We camped that night on the bank of Madison River, not far from the line of Yellowstone Park. We went into camp early and had an hour or two of excellent fishing. The trout struck as fast as we could whip the stream and all the boys caught a fine string.

The next day, Aug. 24, we were on the trail by daylight, and entered Yellowstone Park at Riverside about 10 o'clock. We left all of our rifles and shotguns with the U. S. soldiers at this place, as no guns are allowed to enter the Park unless sealed, and what good would a sealed gun be to any man? Besides we were all ardent sportsmen and were afraid to take our guns with us. We did not want to disobey the laws of the United States and get into trouble, but it would be hard to allow an elk or moose or buffalo to run over one. We camped that night after a tiresome day's travel over mountains and through vales in the famous Lower Geyser Basin, or Fire Hole, as the Indians call it. We found a large number of people, among whom were numerous ladies and children, camped all through the valley. We pitched our tents on the bank of a stream near a large camp of tourists and enjoyed the sights.

The Fire Hole in Yellowstone Park is a veritable fairyland, and even an attempt at a pen picture of it is beyond my power. We visited that day the Prismatic Lake and the largest of the geysers. The next morning we were so fortunate as to see the Splendid, one of the largest periodical geysers, in action. Then we visited Yellowstone Lake, Grand Cañon, the Mud Geysers, Yellowstone Falls and every point of interest in the Park. We had splendid fishing all along the road and caught all the trout we could use. We saw a good deal of game, and often came to where a band of buffalo or elk had just crossed the road ahead of us. We also saw many large bear tracks along the creeks and in the soft places. We had a 4in. snow on the 27th day of August, which we thought rather unusual; but as we had come prepared for anything, it did not inconvenience us much. Altogether we had a delightful week in the Park. The Government has built magnificent graveled pikes to all the points of interest, which render travel easy and pleasant. We returned to Riverside, where we had entered the Park, on Aug. 30, and got our guns, and then drove back to Madison River and camped that night. We again had fine sport fishing, and the next morning by daylight were on the trail again. We reached the settlement that night where we had left the heavy groceries and ammunition. The next morning we repacked the wagons and got in readiness to start to Rexburg, where we were to meet our guide and make a start on the hunt. Ed Simpson, Mr. Ellsworth and his two sons now left us,

We were very sorry to give up these congenial and whole-souled gentlemen, but no amount of persuasion on our part could change them from their purpose. Ed was afraid he was not strong enough to stand the hunt, and Mr. Ellsworth was obliged to return to his business. We traveled hard, following the course of Snake River most of the day. Will McKamy and Frank Gardenhire were riding on ahead of the wagons, and took the wrong trail and went about twenty miles out of their way. That night when we camped on the bank of the river they did not show up. We fired our guns, but could get no reply. We had killed a half dozen wild geese that day; there were several young ones in the lot, and we had two of them baked and stuffed with sage and onions for supper. We were very uneasy about Will and Frank, and knew they were cold and hungry that night. Men who are hunting and camping together soon become fast friends, and no matter how mean and heartless they may be in the business world, they will go their whole length for a hunting comrade. We knew there was no use looking for them at night, but we kept up a big camp-fire and fired our guns at intervals all through the night. By daylight we were through with breakfast and had saddled our wagon horses to retrace our steps to find the boys. We were about ready to start when we heard a gun; we answered by firing three times, and in a few moments Will and Frank rode into camp. They had taken the wrong trail, and instead of following the river had taken a diverging trail which led them back into a regular wilderness. They had gone on and on, thinking we were behind, until near night they came to a large creek. As luck would have it, they found two trappers camped at the crossing of the creek. The trappers told them that they were twenty miles off the Rexburg trail, which we were following, but that they could stay all night with them and rejoin us in the morning. The boys took supper with the hospitable trappers and then slept until about midnight, then taking advantage of a full moon, they retraced their steps and so joined us soon after daylight.

We moved on that day rapidly toward Rexburg. We still followed Snake River and secured several more wild geese and a good many ducks. We had several long range shots at sandhill cranes, but did not bag one. One who has never seen a sandhill crane can hardly imagine what it is. The body is a trifle larger than a turkey's, but flying or stalking around the plains it looks to be almost as large as an ostrich. Their heads are 5 or 6ft. off the ground when they are walking, and their wings are from 7 to 8ft. from tip to tip. The bird has very long legs and wings, and one would think their bodies were large, but they have quantities of very fluffy feathers, and so are extremely deceptive. You must make a dead center shot to kill one at 400yds., and you can hardly ever get any closer. We fired many shots and killed only two on the entire trip.

We camped that night near Rexburg, on a creek, and caught a good string of trout. The next morning we entered Rexburg early, and drove at once to the hotel. We had been in camp now about three weeks and wanted to taste hotel cooking again. We found Ed Trafton, our guide, waiting for us. We consumed the entire day in filling out our list of commissaries and stores and equipments. Each man also bought a saddle horse. We got our mail and each one wrote a long letter home. We were going far into the depths of the wilderness, and it was with a feeling of sadness that we turned our backs upon the telegraph wires and post office. There would not be any possible means of communication with our loved ones for thirty days at least.

It may be useful to some one to know approximately the quantities of groceries to take on a hunt of this kind. There were eight of us, and we were all healthy and hearty eaters, and were to be in the woods thirty days. Our list was about as follows: 500lbs. flour, 150lbs. sugar, 200lbs. Irish potatoes, 150lbs. bulk side meat to use in place of lard, 200lbs. onions, 100lbs. corn meal, 50lbs. hams, 50lbs. breakfast bacon, 5 gallons of syrup, besides about one case each of canned corn, tomatoes, string beans, succotash, French peas, French sardines, salmon, lobster, preserves and jams, also 1 bushel white navy beans, 1 bushel Clay peas, 50lbs. rice, 50lbs. grits, 1 case evaporated dried apples, some prunes and dried peaches and dried grapes and currants, also 100lbs. salt and 50lbs. pulverized alum for preserving skins. This would seem too much to the ordinary observer; but to run out of the simplest article in your culinary department will inconvenience you very much. We were not a drinking crowd, but we took good care to carry a moderate supply of best brandy and whisky we could buy. We were going back into the mountains 100 miles from civilization and could not send after anything, so we also had a medicine box with all commonly used drugs and liniments.

We started early on the morning of Sept. 4 to drive across the plains forty miles to Haden, Idaho. Ed Trafton, our guide, lived at Haden and had to go by home to bid his wife and baby good-by and get his two horses, bedding, etc. We had an easy drive, as the road was good, and killed a great many prairie chickens along the route. We were all getting very expert in shooting their heads off with the rifle, and did not ask Sam Wester and his shotgun any odds at all; we had about fifty birds when we got to Ed Trafton's ranch. The prairie chickens in this far Western country are very tame, as they are not hunted at all; so you can often kill half a dozen out of a covey on the ground before they will fly. As the distance is usually not more than 20yds., a good rifle shot can pick off their heads with great ease. We never thought of bringing in a bird when we struck it in the body, as the boys would guy the life out of you for shooting it in the body.

We arrived at Ed Trafton's ranch and camped near his house that night, and Sept. 5 we spent in camp and caught some fine trout out of the stream that flows by Ed's door. We enjoyed the day shooting sage hens and prairie chickens, and fishing and examining the fine horns that Ed had at his house. Ed is one of the most expert trappers and hunters in the State of Idaho and had accumulated quite a nice lot of very fine specimens.

Sept. 6 we left our spring wagon and surplus baggage at Ed's ranch and took the trail for Jackson's Hole in the famous Teton Mountains. The three Tetons constitute a part of the Rocky Mountain range and derive their name from their peculiar shape, as the word implies. The Grand Teton is one of the loftiest peaks in the entire range and its summit has never been reached. We camped on the evening of the 6th on a mountain stream at the mouth of the big cañon through

which the trail took us. We had enjoyed the day very much, and now had a good supply of sage hens salted down for future use. Next day, the 7th, all hands sheathed their rifles and united their energies in dragging the heavily-loaded wagon up the mountain gorge. We had six good horses harnessed to it and several times had to use a rope and small tackle blocks. We camped that night near the top. Next morning, the 8th, we renewed our labors and about noon climbed out on top of the range. We immediately crossed the summit and started on the descent, camping that night at the foot of the mountain after two days of unheard-of exertion. It seemed to us that we were performing as great a feat as Napoleon in his passage of the Alps. We had to cut a great many trees and logs out of the trail and often to use the pick and shovel to prepare a road for the wagon. In making the descent we cut a fir tree about 12in. at the butt and 40ft. long and tied it to the wagon, then locked both rear wheels, and by using the rope and easing the load down we finally reached the bottom. We used long poles or hand spikes at the side of the wagon when on steep side hills, and by thrusting these levers in the wheels and bearing down on the ends of lever kept the load from turning over.

Ed Trafton is an experienced mountaineer, and with his help and guidance we at last reached Jackson's Hole. A. B. WINGFIELD.

FLY-FISHING

On the North Shore of Lake Superior.

[Continued from page 456.]

Another dawn came; the sun radiantly rose and beautified the gray of the far east, and then sent her beams like golden spears touching the tops of the green trees in her spreading grandeur, and rousing great flashes of silver and gold that flecked the little wavelets in the bay. The forest swayed to the morning breeze, and the little flowerlets that edged our quarters sparkled with the dewy mist that gave them life and tints rivaling the rainbow's hues. A few hungry gulls whose pinions were as white as the driven snow swept o'er the water in search of food, while an entire colony of cawing crows passed o'erhead, doubtless seeking some well-known rendezvous.

It was not only a gorgeous morning for rejoicing, but one that made the angler's heart throb with wild delight. Ned said while we were taking our breakfast that we had better try our old grounds in the morning and in the afternoon cross the bay and see what sport we could find around the big moss-grown and lichened rocks that run so sharply into the lake. Their bases of crumbling fragments form innumerable covers for that fish which is far lovelier to the angler, when in pursuit of it, than Hebe as she waited on the gods, or Venus as she rose in bare beauty from the caressing waves. Strong language, rhapsodical probably, but when one has that ever beautiful fish of the rainbow tints in mind, he heeds not where or how his prosaic pen wanders when comparisons are to be made. It is loveliness vs. loveliness, and he therefore crowns fact instead of fancy, that's all.

The first part of the programme which we had mapped out that morning did not realize very generously, for we only caught two of the red and gold spotted tribe, but they were rare specimens that ran a little over 3lbs. each. We had both lost fish during the angle, and heavy ones at that. One that I had about ready for the executioner slipped away on an unexpected dash, while Ned was unfortunate enough to lose two, one I thought from too hasty a battle and the other I presume from slight impaling, as he slipped off without exacting a single rhythm from the reel or taking a single yard of line. The rod simply went into a crescent and then away went the painted dandy to tell his *confidantes* of his romance, with a humming-bird's wing on a silken thread.

The afternoon's outing panned out more generous, for we killed double the amount, but in a high wind that soon drove us back to our quarters. In this foray Ned had exceedingly bad luck. Being in the bow of the boat, the stiff breeze militated against him and worked to my decided advantage. In commencing, we first came to a small rock over which the rising waves were wildly sweeping. Kenosh, knowing it to be a fine lurking place for trout, warned him to keep a sharp lookout, for he was positive that he would there have a response. He accordingly kept wide awake, and just as we came abreast of it Ned's flies sailed out and lightly dropped just behind the rock, and then a magnificent trout with a panther-like bound sought the lures; but either he or the sportsman was at fault, for no unity ensued.

Ned, somewhat disappointed, recovered his flies for another delivery; but they fell short of the rock, owing to the high wind which was fast driving us along. He then hurriedly lengthened his line a bit, and once more tried, and again failed; for he was further off than ever. As I was now within casting distance of the rock, and according to the rules we had established was next in turn, I of course dropped my flies, received a rise and hung the greedy trout, and after some delightful play he was duly netted and boated.

Ned scolded furiously at the boatmen for their failure to hold back the boat, but Kenosh, somewhat irritated, said:

"Nobody hold boat there. You must take 'em on first jump."

"Fiddlesticks! Couldn't you back water?" retorted Ned.

"No back water there; but didn't we get the fish?"

"I didn't get him."

"I did. What matters it, Ned?"

"Nothing, only you had the delight of the capture, that's all; and that's everything."

"Then take them on the first response, as Kenosh advises," I significantly remarked, and then the half-breed, who was facing me, smiled all over, pleased that he had some one to champion his cause.

The big rocks being just ahead, we push along for them, and here Ned was sure of trout, for he had the first chance and availed himself of it by letting his flies fall over a big, shaded chasm. Again he had a bold response, and again missed. Quick as a wink he recovered his flies and away they whiz through the wind for the same spot from which sprang the food-seeking trout. But alas for his mathematical accuracy and the strong breeze! he missed the place by fully 5ft., owing in part to the drifting of the boat, which he had not taken into consideration. Again he tries, and again the distance between him and the rising trout is increased. He realizes the situation with anything but pleasurable feelings, but when

he sees my flies dropping correctly over the chasm and a ponderous trout grabbing my stretcher fly, a parmacheneebelle, and sailing away with it in his mouth, he is again after the boatmen in a very emphatic manner.

"That's the second trout you have lost for me," he says, as he turns to Kenosh.

"You lose him, not me."

"Yes, I lose him, but why?"

"'Cause you don't hook 'em."

Ned, who always appreciated a humorous retort, couldn't help but smile at this, and very good-naturedly said: "You are right, Kenosh."

"I have the trout, what more do you want?" I put in, by way of adding a little spice to the conversation.

At this Ned gave me an earnest and searching look, but being at a loss how to effectively reply said nothing, and then very earnestly took up his casting with a determination, I thought, to jerk the scarlet head off the next trout that came to investigate his flies. After a few casts he ordered Kenosh to put the boat closer to the wave-washed rock. The dusky boatman obeyed with alacrity, for he was now fearful of again rousing the hostility of Ned, who was in no good humor over his repeated failures to hang a *fontinalis*. The boat neared the rock as per order, but being on the windward side was soon so close to it that Kenosh took up an oar and firmly braced it against the flinty wall to prevent the pounding of the boat. But a moment or two elapsed before the strain upon the oar was so great that it snapped in two, and then a half-breed joined the ranks of the angry. Kenosh then went for his son Jo, who was handling the oars in the front row-locks in such a vehement manner that the young half-breed also went into the company of the incensed. There I was, the only placid man in the boat, and no wonder, for fortune had kindly smiled upon me in awarding me all the spoils.

Ned was almost as sore over the broken oar as Kenosh, for he had contemplated breaking camp in the morning, and this mishap would doubtless prevent it. Kenosh, when he saw that Ned was so distressed over the accident, spoke up and said he would make good the damage that evening if he had to work until midnight.

"Then let us leave here at once," said Ned.

"No, no, want more fish," said Kenosh.

"All right, then," responded Ned, and so we again started in to make lamentation among the finny tribe.

Ned finally hung one of the dappled family and a goodly one too, and had his little world of sport in bringing it to net. This prize drove away all his corroding emotions and he was once more the whole-souled sportsman and made merry music for us all. I caught one more by the rock, a small one, and then word was given for our return. It required a tack or two to make camp, but as the distance was only about two miles it mattered little.

The sails being thrown to the breeze, we started off with a speed that made the water tumble from the bow in snowy sheets of foam, and

"Like one vast sapphire flashing light,
The sea rode on majestically."

"Hello," said Kenosh, with some surprise, "a fog is just coming down on us from the mountains."

"Take your bearings," said Ned, but there being no compass aboard, the bearings had to be of the mental caliber.

"I'll bring her into camp all right," confidently replied the helmsman.

Down came the fog and along we went, trusting entirely to the half-breed to safely make port. After plunging ahead for about twenty minutes the boat was put on the tack, and after the "leg" was made about she went again, but where no one knew—not even our dusky pilot, though he professed supreme knowledge about our course.

Jo said we were near the bottom of the bay, Ned said ditto, and I said naught. After another long stretch the fog lifted and there we were, way down in the bottom of the bay and fully a mile further from home. Kenosh was irritated at the situation, and offered no excuse for the divergence. The son, however, spoke up and said:

"Father no good in fog."

"Yes, good for nothing," admittingly said Kenosh.

He then ordered the sails down and said they would row home, as it would take too much tacking and too much time for the trip. He was anxious, he further said, to select before dark a suitable piece of timber for a new oar. They both pulled up very earnestly, and as soon as we reached a lee shore we made camp in short time.

Kenosh no sooner touched land than he snatched up an axe and hurried off to the green woods, and in about fifteen minutes returned with the necessary wood in its crude form. After working awhile on it he found it worthless and had to return to the forest for a better piece. This time he came back with a sunny smile, declaring that he had procured just the thing for the oar. And so it developed, for the wood was a magnificent piece of white cedar, free from all knots and sap and perfectly straight grained. It took him till 11 o'clock that night to finish the blade and it was as fine a piece of work as if it had come from a turner's lathe. These half-breeds are very cunning with their round-bladed knives, turning out work in the most skillful manner. Jo said he kept the old man at his work by supplying him with very generous cups of strong tea, and substantial tidbits from the larder. He had a hard fight, though, with an army of bloodthirsty mosquitoes and was glad when the job was done.

An unusually early breakfast was had the next morning, and by 4 o'clock we were off, leaving our piscatorial neighbors in deep slumber. We were destined for Raissaines, some twenty miles distant, and with anything like a fair wind would make it long before noon.

The morn was quite chilly and did not look at all promising. Dull, gray clouds were floating o'erhead and the atmosphere was seriously inclined to coax out a dense fog. Kenosh stated that his barometrical bones did not ache, and was positive there would be no rain. Thus assured, as we thought, against a downpour, we went gayly rippling along as if o'er seas of glittering gold, with the tiny waves caressingly lapping the boat as if they were chatting of all the pleasant things they had experienced during the lovely moonlight of the previous night, of the fish that had darted hither and thither between the waves and of the more delicate denizens of the deep that had peeped from the pink doors of their transparent habitations and looked upon the shimmer of their ever moving element as we look on the vast dome of our sky when canopied with silken fleeces.

We thus delightfully ran along a very sinuous and low-terraced shore, studded with spruce, fir and balsam, and a background of towering mountains just barely visible, over which the clouds were sailing in long ranges; now floating along their sides, severing their summits from base, now settling down and capping their peaks, and anon dropping still lower till all the beauty of foliage was suddenly and completely hidden. These grand vistas of mountain ranges were soon obliterated when the prow of our little craft was directly headed for Bachewauung Lighthouse.

Ahead we now look for other picturesque landscapes, for the impressive beauty of the lovely bay will soon break on our vision, with its deeply wooded islands, its lovely shorelands, its rippling streams, and its broad sunny stretches so charmingly enriched with ferns and flowers and shrubbery, that give to the rugged hills an aspect of beauty unsurpassed. The place to a lover of nature is truly suggestive of winsome fairies and frolicsome days, for here

"The velvet grass seems carpet meet
For the light fairies' lively feet;
Yon tufted knoll, with daisies strewn,
Might make proud Oberon a throne;
While hidden in the thicket nigh,
Puck should brood o'er his frolic sly;
And where profuse the wood-vetch clings,
Round ash and elm in verdant rings,
Its pale and azure-penciled flower
Should canopy Titania's bower."

The grand central island which almost divides the entire bay is now passed, and but three miles lie between us and the turret-like lighthouse. The dull and somber clouds are slowly departing and the hues of the rose and the daffodil growing quite frequent, while a glitter of gold is beautifying the edges of the parting clouds. The breeze is gradually freshening, the waves perceptibly growing, and tinkling music sweetly dropping from the dipping prow. Our hearts are therefore measurably lighter and joyous laughter prevails on all sides, while Ned, who has not warbled an aria since he left the "Soo," is in tuneful melody.

The sails began to tighten and bright silver curls around the boat as she plunges bravely over the little white plumes that are just appearing, and dancing where they can mount the arching waves. The lighthouse is also looming up like a ponderous pillar of marbled whiteness, and tree and shrub and rock are plainly outlined.

"Shall we stop at the lighthouse?" inquires the pilot.

"Too rough, I guess, to land there," replies Ned.

"Not a bit. There is a small plank landing in front."

"Hello, there's Mary waving her apron."

"That settles it; we will land and endeavor to secure some wild strawberries and maybe a toothsome bear steak, as it is about time for bruin to be coming down to that point."

In much less than half an hour we were in front of the lighthouse, and the keeper was down at the shore to help us land. Here we had quite a chat, and then I hurried up the bank to the house to ascertain if I could secure some rarity for the larder. Nothing could I obtain but two gallons of maple syrup, for which I parted with a bright silver dollar. Mary and her mother kept me talking so long that Ned, being impatient to leave, fearful the wind might either drop or increase to a gale, sent Jo to hurry me to a conclusion. He came tramping in and picking up the jug, which I informed him had to be taken aboard, walked off with it on the double quick, intimating by his actions that I ought also to hustle along. I caught on without delay, and as I was leaving Mary followed me to the door and there gave me a few pounds of maple sugar, and in addition a bright smile. She also insisted that we stop on our return, for they have so little company in these lone regions that they are always pleased to receive visitors from the "Soo" or in fact elsewhere, that they may hear the news from a civilized community. Our stopping all depended upon the weather. If stormy when passing we would assuredly put in, but if fair it would be onward, as a favorable breeze must be taken advantage of on this uncertain and treacherous lake.

Again we are off with the sails thrown to a stiff breeze, and as the boat gains headway handkerchiefs fluttered from both sea and land.

Four miles more and we reach Pancake Bay, and as the crossing of it is just six miles we make it with the prevailing wind in about an hour. A four-mile stretch still awaits us before we reach our destination, but this is along such a grand piece of rocky coast line that the sail becomes one of infinite delight.

Former years this was one of the finest stretches of trout waters on the lake, but the half-breeds and the Indians with their gill nets and other pot-hunting tactics soon depleted it, and it is now a great rarity here to catch the red-hooded beauty.

Just before we reached Raissaines, Ned insisted that I put my rod together and try for a trout. I complied with his request, and soon my flies were whizzing out on all sides for the beauty in red and gold. For fully half a mile I kept casting, and was about to abandon all hope of securing a rise, when fortune favored me with a response which brought me a small trout of about 4lb. This gave me some assurance, but not another trout rose, no matter how carefully delivered or how attractive the flies, for I think I changed my deceits about every ten minutes, being under the impression that those in use were not the ones to attract. The fish were evidently not there, for the dusky pot-hunters had completely cleaned out the entire coast along the route we were then going.

The bold and rugged shore here and about Raissaines is a grand triumph of nature in reproducing a landscape of impressive grandeur which is deserving some special mention. The flinty rocks that are beaten by the countless storms are worn into strange shapes and stained by a thousand dyes in every possible variety of arrangement, far beyond the power of words to describe, and all this profusion is repeated mile after mile, keeping up interest by some new prospect of sweeping curve or abrupt or fantastic form. No doubt persons who have seen this rugged and frowning north shore under a dull sky suppose that all descriptions of its picturesque grandeur are either deliberately manufactured for the sake of fine writing or illusions of fancy, proofs that

"We receive what we give,
And in our life alone does nature live."

Natural History.

SNAKES AGAIN.

To the Editor-in-Chief:

WORTHY SIR—In the words of Malvolio, "You have done me wrong—notorious wrong!" inasmuch and whereas somewhat more than a year ago I forwarded you a most humane disquisition, an authentic and conscientious extract from experience and contemplation. This contribution to your annals, after reciting specifically, concluded with references and allusions to snakes, particularly rattlesnakes, and finally to snakes generally; and whereas,

After decapitating and dividing the disquisition aforesaid, with the freedom of your autocratic nature and dominion, you printed in these columns the preamble and plot thereof, and then, sir, after holding the summary and conclusion of my contribution aforesaid in captivity and durance for over a year, you turned it also loose through these parallels, your medium, upon humanity at large;

And whereas, this severed portion of the narrative (after the manner of narratives severed from the very subjects of all this matter) wriggled, sir, wriggled and squirmed and did not die; and

Whereas, this mutilated specimen of a barbarous usage attracted the eye of the ever alert and condign personage who asserteth himself to be the high, orthodox, ancient and most potent snake editor of these demesnes, and who subscribeth Coahoma,

Now, therefore, the snake editor uncoileth in his wrath, after the manner of the subjects of his charge, and bruise my heel; he striketh blindly, but his fangs are keen, and he is wise like his serpents, and he is not to be disturbed rashly. But, sir, he becometh aggressive, and there is enmity betwixt him and me; and, as appeareth even in the Scriptures, he bruise my heel, and I shall bruise his head;

Therefore, whereas and moreover, and inasmuch as you, as dictator in this realm, are not altogether blameless for these things, I pray you to withdraw and let me get at him.

Sir, your sincere but injured petitioner affixeth his hand and seal.

RANSACKER.

To Coahoma, Patron and Protector of Snakes:

WISE AND SUBTLE SIR—By your recent and sinuous movement our natural antipathies are aroused. There is war betwixt ye and me. Incidentally, and while roaming in the byways of nature, our common heritage, I trod upon or disturbed your hidden coil. You immediately assume the aggressive, strike and inoculate me with venom. Smarting with the punctures you make, I turn upon you, therefore perpend and beware!

You resort to your proverbial attribute, wisdom, as well as fangs, in defense of your wards, the snakes; you quote from authority as ancient as Æsop himself; you wield the invincible argument of example and personal observation; you appeal to sympathy, reason and judgment; you array before us the fundamental ethics of natural conditions; you smirch me with accusation, scorch me with philosophy, stigmatize me with imputation, calumniate me with references and allusions to suspicion, treachery and crime itself. In short, sir, you handle words with artistic skill.

But, sir, you excuse the imperfections and shortcomings of your clients, snakes, by endeavoring to pull down the entire "fabric of mundane life" to the level of reptiles that grovel on the earth and glide from cranny to crevice, hole to hole, and shrub to flower in the most abject and despicable attitude assumed by any living creature. We might forgive them the misfortune of their physical modes of existence and style of locomotion could we detect in them a single redeeming trait or noble attribute. There is no trite comparison to be made between the serpent and the winged and fearless fowls or pirates of the air; he has nothing in common with the noble American bird, the gobbler; my affectionate friend, the cat, is one of the domestic and adopted dumb friends of man, cherished for ages of fidelity, and the serpent has no trait of his save his meanest—treachery to his victims. Truly, the snake has no affinity in or for any creature but the reptile family; no love for anything, no aspirations above the dust of the earth, and, in the selfish estimation of man, he is neither valuable, beneficial nor ornamental.

Sir Coahoma, you assign mercy to be the distinguishing characteristic of man. So be it. It is a most godlike and virtuous attribute—an attribute Shakespeare has applied to "God himself." But in the economy of nature—in the eternal or universal strife for existence—I say it is impossible for anything of life to obtain and be uniformly merciful or immaculate. Life of one means destruction to many. The whole problem is embraced in the theory of the "survival of the fittest."

While nature is seemingly conservative or her final result or tendency is beyond our comprehension, who is to solve the problem but man himself—whom we conceive to be the highest in intelligence—the lord of creation? We are sweeping the American Indians from the earth, from their native and natural domain; beasts of the continent have been and are being annihilated in our usurpation of their haunts and homes; fowls of the air, the denizens of ocean itself, are being decimated to supply our needs or greeds; nay, creatures of our own kind are dying by thousands for lack of sustenance and before the immutable law.

While these conditions are evident and indisputable, I clasp hands with you for merciful sympathy for every living creature. I stand with you in denouncing and detesting any man or being who (or that) wantonly destroys the life given by the great Creator of the universe. I think the wanton and deliberate destruction of life by man one of his most despicable vices, and that he who would murder a robin in mere viciousness would murder men or babes if he dared.

Coahoma, you accuse me unreasonably of "unreasoning prejudice," for I do not, never did and never shall either "kill all the snakes that come in my way" nor advocate the wanton destruction of anything of life. When I am forced to strike for the "survival of the fittest" I will use the best judgment and reason I have. If a poisonous reptile threatens what I consider a worthier creature, or one more valuable to higher things, I will kill him if I can; but will do it because there seems to be no more humane method of abolishing an evil. I have had to con-

tend with some rattlesnakes for my own safety. I kill them at sight.

In conclusion let me say: "We grope, Coahoma, we grope." Our boasted humanity itself is founded on the principles of our own feeble conceptions. There is little at most that "is either good or ill but thinking makes it so." We can learn to love or hate. You and I only clash because we worship at the same shrine—the same incomprehensible and sometimes, as appears to us, inconstant Dame. Notwithstanding her coquettish moods she improves upon acquaintance. We "spy entertainment in her; she casts the leer of invitation; she discourses, she

NEST OF RUFFED GROUSE.

Photo by Mr. G. Hills.

carves." "Age cannot wither her, nor custom stale." Familiarity with her does not breed contempt, but increasing reverence.

Recall your verdict of "unreasoning prejudice" and I hereby revoke my allusion to snakes having "slimy folds." I admit the error. But with all deference let me say, I would send all the serpents on my ranch down to you of Mississippi if I could corral 'em and pay the freight.

RANSACKER.

PHOTOGRAPHING A SITTING GROUSE.

MR. G. HILLS, of Hudson, N. Y., sends us the accompanying admirable photographs of a ruffed grouse nest and the hen on the nest. He incloses with them an interview written by Mr. Horace B. Derby, of the *Albany Argus*, which we quote; Mr. Hills tells us that of the thirteen eggs in the nest all but one were hatched:

"Mr. Granville Hills, of Hudson, is one of those rare sportsmen whose love of all that pertains to field, covert and woodland is such that he takes delight in 'hunting without a gun,' his favorite weapon being a camera with which he makes the most unerring shots at the denizens of the tangled swamps and thorny coverts, and his game

RUFFED GROUSE ON NEST.

Photo by Mr. G. Hills.

bag a portfolio that contains the proofs of his prowess in the form of many exquisite examples of photographic art.

"Mr. Hills's efforts, for many years, have been especially directed to the photographing of wild birds on their nests, and several seasons ago he actually succeeded in getting a capital picture of a sitting woodcock, a full account of which, with a description of the picture, was given in this department of the *Argus* at the time. Since then, with the return of every breeding season, Mr. Hills has been unceasing in his efforts to get a picture of that pride of the upland covert, a ruffed grouse, in the performance of the duties of incubation. Repeated disappointments that would utterly have disheartened any but this enthusiast seemed only to spur him to renewed effort, and last Tuesday the undaunted fellow came to see me at my desk, bearing the long-coveted picture in his hand.

"The picture is one that will appeal to the heart of any lover of the wild wood folk, for it shows a hen grouse on her nest in the tangle of a jungle-like bit of covert, and in the lower left-hand corner of the photograph appears a tiny auxiliary picture of the nest and its precious freight of eggs. In answer to my eager inquiries as to how he obtained the photograph, Mr. Hills related the story of the strange and novel quest, which I will give my readers as nearly as possible in his own words:

"The nest of the ruffed grouse shown in the picture," said he, 'was found in a piece of low, swampy covert, situated in the town of Glencoe, Columbia county, about nine miles from the city of Hudson. The nest was placed

within a few feet of the wagon-track of a lane leading to a farmer's house, off the main road about an eighth of a mile. This nest was first discovered on May 16 by the farmer driving cattle along the lane, when his collie dog flushed the grouse, and suspecting that it was a sitting bird the farmer looked for a nest, and the precious prize was found. The nest then had twelve eggs in it. The same evening, going to pasture for the cows, he saw the hen sitting on her nest. The following morning, returning the cows to pasture, the farmer noted that the grouse was absent, but an investigation of the nest showed that there were thirteen eggs in it.

Photographing the Mother Grouse.

"On Sunday, May 17, the farmer sent word to me of the discovery of the nest, but the next few days being unfavorable for the taking of photographs I did not visit the spot until the 21st. On the latter day, accompanied by Mr. Samuel Rowles, an expert with the camera in all field work, I drove directly to the nest, which was plainly visible from the carriage, but the noise of our arrival did not seem to startle the bird, for she did not move. Took the horse to the farmer's stable, returned and set up camera. Walked up to within 10 ft. of the nest and, fearing that a nearer approach could not be made, took a snap shot at that distance; then moved up about 5 ft. nearer and got the negative, the print of which you have before you. The bird now became alarmed and flew away, and then, without changing the position of the camera, we photographed the eggs. We waited for the bird's return until 6:15 P. M., and, fearing to keep her from her nest too long, we decided to postpone further effort for the time. Furthermore, we had some misgivings as to how our work would pan out and we were anxious to develop the plates. This was done on our arrival home as expeditiously as possible, and we found, to our huge satisfaction, that we had three good, sharp negatives. The one I show you of the grouse on her nest is the result of the second shot, and the group of eggs of the third.

"It is human to crave better results than even those obtained from earnest effort, and nothing would satisfy us but another trial; so we planned to go to the grouse bower the next morning at break o' day, thinking that a better light might be afforded at sunrise for our work than on the previous occasion. Four o'clock in the cold gray of the morning saw us en route for the swamp, and on our arrival we found Madame Grouse at home, quiet and happy, attending strictly to her efforts to bring about maternal responsibilities. The two good negatives we had previously obtained were taken at short range, and this emboldened us to make an effort to get a shot at still closer quarters. At length, by careful maneuvering, we managed to set the camera within 3 ft. of the nest, had it well focused, but when ready to press the button the bird sprang from the nest and away she went. Other duties would not allow us to make a day of it in the swamp and we returned home.

"On Saturday, May 23, we went again to the swamp, and in the cool shades prepared to spend the day, and the night also, if necessary. Found Madame at home, surrounded by a fierce and bloodthirsty bodyguard of midges and mosquitoes. The latter seemed to recognize in Sam a tenderfoot and interloper, and went in to score him unmercifully. They swarmed upon him at all vulnerable points, but he managed to set up the camera, though the work was sadly hampered by the wild whacks he showered upon his tormentors. It was then just 2:10 P. M. All was ready for a successful shot when a mosquito, which Sam declares was armed with a gimlet, darted at the half-crazed photographer's nose. The puncture the little devil made in Sam's proboscis was so keen and carried so much fire with it that the victim forgot his caution and made a crack at the enemy that might have demolished a wooden Indian. The wild movement of Sam's fluke and the resounding slap that reverberated through the silent glade like a pistol shot proved too much for the nerves of the timorous dame, and she lit out like a flash.

"We waited fully an hour for the grouse to return, while Sam nursed his wounds with one hand and fought his tormentors with the other, but the bird came not. As I had noted the direction she had taken, I walked around on the further side of the swamp and in less than three minutes flushed the bird, which at once flew back to the location of her nest. But she evidently dreaded another exhibition of the fearful antics of Sammy, for she would not go on the nest, and after vainly waiting for her re-occupation of the premises until 5:45 P. M. we gave up in despair, packed the kit in the carriage and started for home.

"As we drove sadly away we thought to take a last look at the nest, and lo! there sat the grouse. There was an immediate unpacking of the equipment and hurried preparations made for another shot, but when we attempted to invade the sanctity of her woodland bower the bird again took wing, and we abandoned the task for good and all.

"In my efforts to secure a photograph of a nesting grouse I have engaged in a faithful search of various covert in Columbia county for three years. Each season I have found a nest of this royal game bird, and have gone early and late to where it was cannily hidden by the mother grouse, devoting a vast amount of time to the search and the securing of the prize, and employing every device I could think of to circumvent this wild and wary dweller in the shadowy depths of the woodland dells."

Ring-necked Pheasants for Canada.

MACOMB, Ill., May 28.—*Editor Forest and Stream:* I received a letter to-day from Mr. H. P. Dwight, game warden at Toronto, stating he had seen an article in the *FOREST AND STREAM*, written by myself, on the Mongolian pheasant. The Government has set apart eighteen townships for a game preserve; they propose to stock it with these beautiful pheasants, and he asks where the birds can be had for this purpose. I am truly glad to see the Canadian Government taking such an interest in introducing these beautiful game birds. I hope the State of Maine—which is the finest game State in the Union—will take a hand in this enterprise. Why should not Maine establish a game park for her large game where it can be protected? They have the beautiful lakes, meadows and timber—in fact, they have everything to encourage such a movement.

W. O. BLAISDELL.

WILD PIGEONS IN THE NORTHWEST.

VICTORIA, B. C., May 28.—*Editor Forest and Stream:* During my thirty-four years' residence on this coast I have never known the passenger pigeon (*Ectopistes migratoria*) to be taken either in Washington or British Columbia. The band-tailed pigeon (*Columba fasciata*) is a regular summer resident both here and in Washington, and this year has appeared in considerable numbers in the neighborhood of this city, our markets being pretty well stocked with them at the present time. The two birds are very much different.

JOHN FANNIN.

TACOMA, Wash., May 27.—*Editor Forest and Stream:* The moment that I read your valued comments upon my observations upon the wild pigeons of this coast I realized that I had not been as careful as I should have been in looking up the natural history of these interesting birds before classing them with the Eastern variety. But it is over twenty-five years since I have handled the wild pigeons of the East, and the close resemblance to the bird of the Alleghenies, as I remembered it, quite disarmed me. I rang up an old Wisconsin market hunter who has netted thousands of wild pigeons and read my article and the editor's note to him. He asked me if I had not noticed that "these pigeons out here coo, while the Eastern ones cackle." I confessed to forgetting the distinction.

I met twelve of my associates who had lived in the East in prehistoric times, and "knew all about wild pigeons." Each said in turn, in answer to my interrogatory, that "of course they are the same."

Thus encouraged I extended my walk to a market where game is sold, and was delighted to find a coop of wild pigeons netted over in the Gray's Harbor district and just brought in to the city. I immediately bought a pair alive and repaired to my office again to re-read the footnote called out by my article, in the light of an enlarged experience and with the subject under discussion actually in my hands. Permit me to acknowledge my obligations to you for having called my attention to that fact. Just to show you that you are absolutely correct in your description of our pigeon, I have had the taxidermist prepare one of these pigeon skins, and will send to you by mail within a day or two. The moral of this story and sequel is that thirteen errors don't make one truth, and that there are radical points of difference in varieties of the same species that are easily overlooked, especially when a fellow has to depend upon memory.

Another point worth considering is the educational value of FOREST AND STREAM. Through its columns I have learned many an interesting and valuable lesson. And so I think have we all.

J. A. BEEBE, M. D.

AMERICAN MUSEUM OF NATURAL HISTORY.

THE report of the President of the American Museum of Natural History has just been received. It is a stout volume of about 100 pages and is illustrated with a number of plates giving views of the museum building and of some of the halls. Besides the annual report of the President, the volume contains the Act of Incorporation of the Museum, its contract with the Department of Public Parks, the Constitution and By-laws and a List of the Members for the year 1895.

The year just closed has been for this Museum one of marked activity in the development of the collections and the educational work of the Museum. The receipts from the city and from the endowment fund, which amounted to nearly \$140,000, having proved insufficient for the keeping of the Museum running and the increase and development of the collections, the deficiency of nearly \$7,900 was met by a special subscription from the trustees, thus enabling the Museum to commence the current year free of debt. During the year 1895 an act was passed by the Legislature authorizing the State to erect an extension and authorizing an additional grant of money by the Board of Estimate and Apportionment. The new wing, which is now in process of erection, will, it is hoped, be completed within the year.

Numerous expeditions have been kept in the field by the Museum and the results of these have been important additions to the collections in various branches. An expedition in Peru under the direction of Mr. Adolph F. Bandelier has been so successful that arrangements were made to continue his work until the close of 1896. During 1895 he sent the Museum ninety cases of objects excavated either by himself or under his personal supervision, and supplemented this material with photographs, maps and charts of great importance. Expeditions in Honduras, Sumatra and Mexico have produced good results in the departments of Archaeology, Ethnology and Zoology. One of the trustees of the Museum contributed a considerable sum toward the expense of the Peary Relief Expedition, and a collector who accompanied the expedition on behalf of the Museum brought back a valuable lot of birds and mammals.

Much has been done by the Department of Public Instruction chiefly in the way of lectures delivered to the teachers of the public schools by Professor A. S. Bickmore, but besides this lectures were given by members of the Linnæan Society and by others.

Among the collections received during the year 1895 which deserve special mention was the gift of the William Dutcher collection of over 2,000 specimens of Long Island birds, contributed by the Linnæan Society of New York. The huge elephant Tip and the moose group were prepared during the year. The preparation of a group of mountain sheep and one of mountain goats are in contemplation. In the Department of Vertebrate Paleontology the most important additions were the Dope collection of fossils, said to consist of 10,000 specimens. Besides these many tertiary fossils have been collected by expeditions sent out for the Museum. In the Department of Anthropology much has been done under Dr. Putnam and Dr. Boaz, and we may expect before long to see collections exhibited in this department which can only be equaled in this country by those at Washington. The present condition of the Museum appears to be most satisfactory.

Partridge Budding and Diving.

Editor Forest and Stream:

I notice in your number of May 9 an inquiry by J. H. D. wherein he wonders why it is that among the numerous writers in FOREST AND STREAM they have never

mentioned the habit of the partridge as to budding and diving.

In my boyhood days I had time and opportunities to study the nature and habits of that bird very closely.

Yes, the partridge or ruffed grouse is a budder, also a diver, provided that he has deep, light snow to dive into.

The partridge is the only bird that I know of that can live on browse. It is when the snow lies deep they forage on the treetops, where the birch and the cherry seem to be their favorite buds. But in the absence of birch or black cherry they will work on various other kinds of treetops, and are very fond of the apple tree buds whenever they find them near the woods. The budding is done mostly late in the day.

Many are the times I have watched to see them mount the treetops, which generally they would do about 4 P. M.

They don't start up with a hum, as though they were shot from a catapult, as they do when started by a man or dog; but very quietly they rise up from one limb to another on a slanting ascent, and while I have been watching under the birches to see a half dozen or more one after another getting into the treetops, perhaps a dozen more have gotten up from the other side without my notice. Very tame they were where they had not been disturbed by much shooting. After sunset, and when twilight sets in, they begin to dive off, one at a time, with spread wings and never a flop.

I have never found any of those birds that were crusted under. Below that they can generally dig out. But in the latter part of winter there may be several weeks that they can't dig in, in which case they invariably roost on the lower limbs of small hemlocks or any other evergreen tree, as I have never known them to roost high.

ANTLER.

The Zoölogical Society.

At a meeting of the executive committee of the New York Zoölogical Society, held June 3, a body of ten scientific men was chosen to be known as the Scientific Council and to act as an Advisory Board with the Director of the Garden. The council consists of Messrs. William T. Hornaday, chairman, director New York Zoölogical Park; Madison Grant, secretary *ex-officio*, secretary New York Zoölogical Society; Professor J. A. Allen, curator of mammalogy and ornithology, American Museum of Natural History; Frank M. Chapman, assistant curator of mammalogy and ornithology, American Museum of Natural History; Professor Henry F. Osborn, Da Costa professor of zoölogy, Columbia University; Professor William Stratford, College of the City of New York; Professor W. Gilman Thompson, New York University; Dr. Tarleton H. Bean, superintendent New York Aquarium; Dr. George Bird Grinnell, editor FOREST AND STREAM; William A. Stiles, park commissioner, city of New York, editor of *Garden and Forest*. It was also decided to send Mr. Hornaday to Europe to inspect the best zoölogical gardens of Germany, Belgium, Holland, France and England, to make special studies in the lighting, ventilating and heating of the large buildings for animals.

Animals for a Game Preserve.

MR. CHARLES PAYNE, of Wichita, Kan., was recently in this city, having come on with a shipment of wild animals intended for a game preserve. He brought with him thirty-eight deer, 117 squirrels and twenty-two jack rabbits. These are all to be turned loose in a game preserve, the owner of which is not named, but which is situated about 100 miles west of New York, in a spur of the Alleghany Mountains.

Game Bag and Gun.

A RABBIT HUNT IN IOWA.

IOWA.—*Editor Forest and Stream:* I had noticed the symptoms coming on for some time. There was no mistaking it, it was the same old disease. I could not lay that feeling of discontent, restlessness and general dissatisfaction to anything else. My digestion was perfect, my credit good, my wife had not given me any curtain lectures—in fact, everything was running as smoothly as possible; still I was not happy.

Reader, if you are a lover of the rod and gun, I think you can readily diagnose my case; and though you may not be a physician, I believe you will agree with me that there was but one remedy for my ailment—that is, a good hunt—and that remedy is a most pleasant one for me to take.

Christmas eve there was a heavy fall of snow—that settled the matter. The next morning I shouldered my gun and started out. Turk, my old black setter, looked up appealingly, then whined and begged as only a bird dog can beg, but it was of no use. No, Turk, you cannot go. Down, sir! And almost heartbroken the old fellow sought his place behind the hard coal base burner; for, be it understood, Turk is a privileged character, and has fully earned the privilege of occupying a place behind the stove. My reason for not allowing the dog to go with me is that he is twelve years old, and every time he gets wet and cold he has an attack of rheumatism.

It was about 10 A. M. when I started out to the west of town on foot. A walk of about one and a half miles brought me to the old H. farm. Here I scouted the cornfield thoroughly, but not a sign of a rabbit could I find. It is evident the bunnies have not stirred from their hiding places since the snowfall; probably to-morrow will be a better day for hunting them.

Turning south, I plodded slowly along through the newly fallen snow. How white and beautiful the earth is in her garment of white! How quiet the world seems, with not a living thing in sight! The morning air, so fresh and invigorating, and the beauties of nature are alone sufficient to repay one for a long tramp on a quiet winter day. As I leisurely make my way along, old and familiar landmarks bring back to my memory events that happened in the many hunts of the past which I have made in this same locality.

On this same section of land, years ago, before the drain tile came into use in central Iowa, have I slain many a mallard, and there is not a forty-acre tract of land within a circumference of five miles on which I have not flushed and killed that king of the Western prairies, the pinnated grouse. It makes my blood tingle now as I think of the many, many times I have stood

behind my well-trained dog, as, like an image of stone he stood, with nose and tail outstretched, waiting for me to flush the unseen game. The true sportsman and philosopher can derive happiness in thoughts of friends and events of bygone days.

Just over there, along that willow hedge, M. J. Smith and myself had one of the finest afternoons of quail shooting that it has ever been my good fortune to enjoy. That was three years ago, and M. J. Smith, as true a sportsman as ever read FOREST AND STREAM, has "passed over the river" to the happy hunting grounds. I never pass that old hedge without thinking of him, one of my best friends. During his last few months of sickness, when he had to give up shooting, FOREST AND STREAM was a great comfort to him, as I suppose it is to many another invalid sportsman.

Even the thoughts of those who have gone before us oftentimes bring a gleam of sunshine into our lives.

But hark! from the south I hear the report of a gun; there it is again and again. Evidently some one is more fortunate than myself, as I have not yet seen anything in the way of game.

Well, here is something interesting. The fresh tracks in the snow indicate that a large covey of prairie chickens have been here not more than an hour ago. It is the close season for chickens now, so I leave the gun on my shoulder, but from the hunter's instinct follow the tracks. After walking about 100 yds. I notice the scalloped imprints of the tips of a pair of wings in the snow—evidence that one of the birds had taken wing. Walking on a short distance, I see numerous scalloped imprints in the snow, and then the tracks come to an end. About 30 yds. further on are the tracks of a man, and so I read on the fresh white page of nature's book that about fifty prairie chickens have been feeding here this morning on the few ears of corn which had been overlooked in husking, when a man, probably the one I had just heard shooting, flushed them.

Crossing over to the west side of the field, so I will not be hunting over the same ground which the man who preceded me has been over, I soon discover fresh rabbit tracks. Following the tracks about 50 yds., I come to a round hole in the snow, and as no tracks lead away from the hole, I am certain Br'er Rabbit is at home. Bringing the gun down to a "ready," I gently stir the snow with my foot, when out pops Br'er Rabbit; but on account of the deep soft snow I have to wait for him to get to a suitable distance before shooting. Then the gun comes to my shoulder, a glance across the barrels, a slight pull on the trigger, a sharp report, and I will have rabbit for dinner to-morrow.

In about ten minutes' walk I see more rabbit tracks, another hole in the snow, and I soon have another rabbit. After a short walk there are more tracks, another hole, and of course I will soon have still another rabbit. Gently I stir the snow—out he goes. Poor fellow! I have to wait for him to get far enough away so the shot will not tear him too badly. There, 30 yds. is about right; bang! But just before I pulled the trigger he dodged behind a bunch of corn stalks, made a sudden turn, and I missed him—all because I was too sure of him. Before I could fire again he was behind a willow hedge, then into a tile drain and safe under the ground.

A half mile further south, and I arrive at the place where I had felt sure I would have some good shooting; but the fresh tracks of a man around the brush heaps furnish more reading matter for me in nature's book. Those shots which I heard about a half hour ago were fired here; some other fellow got my cake. Sitting down on a pile of wood, I reach back into my game pocket and get out the lunch which my better half had put up for me. The butter on the bread and the meat are frozen, what of that? I have the most delicious sauce man ever had, a hunter's appetite. After lunch I start for home, and on the way get another rabbit. Within about a mile from home I get a chance to ride and am soon home.

Perhaps some persons would think three rabbits very small pay for a four hours' walk in the deep snow, but to me the game is not the only consideration. The outdoor exercise, the fresh, invigorating air, the beauties of nature, and the leaving behind of the cares of life for a few hours are to me of priceless value. I firmly believe that a love of field sports and an occasional gratification of that passion would cure the worst case of dyspepsia in the country, and cause a man who is subject to "blues" to face many of the trials and troubles of life with a braver heart and firmer resolution. JOHN C. BRIGGS.

CALIBER CONCLUSIONS.

Editor Forest and Stream:

In your issue of Jan. 11 last I sought information regarding the most suitable caliber and ammunition for big game hunting. The replies have been numerous and sent in by practical hunters and woodsmen, and their conclusions have been reached only as the result of actual experience afield. Personally I thank each and all of them for their great kindness in so carefully considering my request. As a brief résumé I draw the following conclusions:

From nineteen replies there is one who prefers exclusively a .50-caliber, two who say a .45 or .50, nine who chose a .45, one a .44, two a .40, three a .38, one a .35, and wherever a .30-cal. is mentioned it is condemned as a "crochet needle" gun and wholly unsuitable for the purpose of large game hunting, and one writer does not consider it worthy for target purposes. From the above, the large calibers are clearly the choice of the writers, and these men are principally moose hunters, and together with the large caliber they want an enormous load of powder—100 to 150 grs.—to propel a solid soft 300 to 500 gr. bullet.

With this arm and ammunition, up to a distance of 100 to 200 yds., the large quarry, if fairly hit, is smashed into butchers' meat on the spot, thereby avoiding a weary and uncertain chase after a suffering animal. This conclusion was the one I theoretically arrived at in a letter of inquiry when I wrote that "the large majority of big game are killed nearer than 100 yds. off; and if this be true, and the above theories are correct, the larger caliber and soft bullet would be the surer and most humane destroyer."

The objections to these big guns appear to be their weight on a long tramp, the greater recoil from their enormous loads of powder and their inaccuracy at distances beyond 100 yds. Yet in spite of all these objections, if I were to go after moose, caribou or grizzly, I would want one of these guns.

The large majority of hunters, however, never expect to hunt moose. The white and black tails and small bears encompass their environments, and their search is associated with long tramps. The life of these lesser animals is more easily knocked out than the larger game, and though many herculean hunters prefer the .45-caliber, they use a powder charge below 100grs. and a bullet below 300grs., thereby avoiding the great recoil of the larger charges. To a novice, like myself, this caliber would appear to be still the best for deer in our woodland areas, where near distances from the game are the rule, because of the greater destructive power of this weapon in the hands of a poor hunter; for if the game is hit anywhere it is far more likely to stop than if the lesser calibers are used.

Three writers claim that the 7½lbs. .38-caliber is big enough for any game, and they are men of many years' and racy experience; and one of these, personally known to myself, is one of the best shots that ever handled a rifle. He is like the Boer who only took along two cartridges when he went for two spring bucks, and got them too. In short, he never shoots until he is practically certain of the result. Here comes the "man behind the gun" in its full value, and undoubtedly in the hands of these three men of iron sinews and unerring eyes their 38s are equal to all requirements. They never shoot at random, and hunt deer principally, with occasionally an elk or bear, or a moose.

The other caliber men have been so fully answered during the correspondence that it is unnecessary for me to refer to them here. My mind is now all made up on calibers, as I have gotten from the correspondents of "our paper" clearer views than I had before, and other novices must have profited likewise. My first gun ought to be a .45; and after proficiency is fully acquired, especially if hunting the lesser large game, I shall buy a .38, unless in the meantime an arm of still greater value comes upon the scene. A. H.

A Ravening Monster.

EDMONTON, N. W. T., Canada.—*Editor Forest and Stream*: Please find inclosed a description from the *Winnipeg Free Press* of a strange animal killed near White-wood, Northwest Territories.

"Robert Cosgrave, a farmer living six miles east of Whitewood, one day last week noticed a monster wild animal go toward his flock of sheep, which were grazing on the prairie about a half mile distant from his house, and catching up a full-grown sheep in its mouth carried it off with as much ease and grace as a cat would with a mouse. Mr. Cosgrave at once gave chase on horseback and with a rifle, and chased it about a mile. Here he opened fire, which caused the brute to drop the sheep, which lay quite dazed for some minutes, while the brute scampered off at an independent pace. Mr. Cosgrave was thankful to save the sheep, and took it home not much the worse. But this was not the end. Mr. Cosgrave took a dead lamb and poison and trailed it up to where the brute had dropped the sheep and left it there. Next morning he went in search and found the lamb had disappeared. When he had ridden about a mile further on he found a large beast lifeless, and was obliged to return for his buckboard to take the monster home.

"On measuring he found it was 8ft. 2in. from nose to tip of tail and 3ft. 4in. tall, weighing 85lbs., and with paws larger than a man's hand. The Indians say they have never seen anything like it for years and as near as the settlers can make out they call it 'the Buffalo Hunter.'

"This is undoubtedly the pest and enemy of the ranchers along the Pipestone and Moose mountains, of which so much has been heard this last year, many colts, calves and sheep being reported killed by timber wolf or mountain lion unseen. All the farmers feel grateful to Mr. Cosgrave for ridding the district of such a destructive pest."

What the animal was is a puzzle to everyone here; please enlighten our ignorance. W. H. COOPER.

A Handless Shooter.

ST. PAUL, Minn., May 30.—*Editor Forest and Stream*: Since your search for the "armless sportsman Fuchs" has given you renewed evidence that some men will lie, I am going to stake my reputation against your good will for me, and I will help you out of a dilemma and prove to you that there does live in the United States a man who is minus both hands and who without the use of a hook does both shoot and fish with success. It is a story I could have as well told you years ago, when as a boy I lived in Delaware.

At Dover, Delaware, in the early '70s, while a Fourth of July celebration was in progress, an old cannon burst and tore one hand from Jake White and both hands from Jim Wilson, colored men in attendance. My earliest recollections of Jim Wilson are of a large, good-natured mulatto going through the streets of the town selling fish from a basket. Now this man has gunned and fished in that vicinity these many years and is there yet, unless recently dead. With both hands off at the wrists Jim Wilson is a gunner and a good shot. I have seen him with his powder flask and shot pouch load and ram home the charge in his muzzle-loader; have seen him by a string attached to the trigger discharge it with his teeth; have seen his rabbit or squirrel tumble over, and have seen the dead game in his possession—and Jim Wilson does not use a hook on either arm stump.

More than this, Jim can do and does a hard day's work, oft repeated, for his occupation is that of a well digger; and I have seen him as unconcernedly fill a bucket with sand at the bottom of a deep well as any laborer with all his members. WM. L. TUCKER.

A Preponderance of Drakes.

Editor Forest and Stream:

In one of the spring issues I noticed an observation that of the ducks killed by the observer 80 per cent. were males. I have to confess to the heinous crime of duck hunting this spring, and also noticed the great preponderance of male over female birds in the flocks seen. It was no uncommon thing during the first warm days to see four or five bluebill drakes swimming rapidly after one poor little duck, and when she could stand it no longer she would get up and fly, followed swiftly by her many consorts, which chased her until she again alighted in the flock. Again during one day I counted the ducks killed by two of us, and out of forty-five there were only nine females. Can any one give a correct explanation for this great difference in sex numbers? A. H.

Sea and River Fishing.

SALMON ON THE GRAND CASCAPEDIA.

The First Fish a 40-Pounder!

GRAND CASCAPEDIA RIVER, P. Q., May 30.—*Editor Forest and Stream*: I doubt not that almost all of my fellow anglers—readers of *FOREST AND STREAM*—have either killed a salmon or with eager interest have read about how it is done; but this salmon of 1896, the leader of the host that is now entering this noble river, was killed under such peculiarly exciting conditions that I feel sure an account of how it was done will not come amiss.

On Tuesday last, May 26, I was sitting in my office in New York (trying to keep cool) when a telegram was handed me with the welcome information, "Salmon being taken in the nets out in bay!" This was enough to cause a commotion then and there. A general scurrying about, packing of trunk and rod box and hurried orders; so that within twenty-four hours I was en route for the Grand Cascapedia, and at daybreak this morning the good steamer Admiral delivers me and my belongings safely to the whale boat that lands us at New Richmond. Once ashore, a dozen hands are extended and a dozen kindly voices bid me welcome, for be it known that this is my tenth year as a fisherman here.

Of course I am all curiosity and anxious to know everything possible as to the prospect for sport. "Are the fish in yet?" "Yes, it is thought they are." "And Peter! tell me about the water; is the river too high or too low?" "Just about right, sir!" "And have any fish been seen yet jumping in the pools?" Nobody can answer this question, for none have yet been seen; and for the information of my readers I might mention the fact that never before have salmon been taken in the bay nets so early as in 1896. The season is at least ten days to two weeks ahead, for I have never before heard of salmon being taken with the fly prior to the first week in June.

So in a little while I found myself at the door of Peter Barter's hospitable home, again to be welcomed by all hands, including the grown-up boys and girls whom I have known from early childhood.

The rod box is opened, the rod selected and put together, leaders soaked and stretched, flies chosen, dinner eaten (and in a hurry too) and at last we are in the canoe, off for the Lowry Pool, to see what we can do there. This pool is quite a long one and I begin at the head of it and carefully thrash the water, but no rise; another drop of the canoe and more faithful use of the silver doctor fly, and still no response. Thus it goes until, drop by drop, the canoe approaches the lower end of the pool. Not a sign of a salmon; no fish rising. Over two hours of hard work have slipped by and we are getting discouraged and beginning to believe that we are too early, that the fish have not yet begun to run the river. So I am casting away more for practice than anything else, and with but little care, when suddenly like a flash comes a swirl and rush in the water. Hardly had this subsided when again out of the water leaps clean and clear an enormous fish straight for the fly, and misses it. Meanwhile (shall I confess it, old fisherman as I am?) I stand almost petrified with astonishment, for I had really given up all hope of a fish.

To "up anchor" and get out of here is the work of a moment, for there are logs running in the river, and just at this moment the water is full of them; and we must wait until the bulk of them have passed, so that we can have a clear space to try again for that salmon. So we go ashore and watch the logs go by for five minutes—ten minutes—and Peter says, "I guess we can try him now; I think the logs have stopped running for the day." So again the canoe is anchored in the same place as before, and again I begin to drop the silver doctor with all the care and skill I am possessed of. Slowly the fly, cast by cast, begins to approach the right spot. At last it comes—a rush! a swirl! a big splash! and the salmon is hooked hard and fast.

"Aha! Peter, I have got him this time," I shout, as the fish starts—thank heaven—up stream, and the canoe swings about and away we go after him. My rod is feeling it now, for the fish is running, and running deep too. But as we turn our faces up stream we stand aghast, for the river is full of logs again, floating with the current straight for us and our fish. If he makes a quick run, if he jumps, surely he will get the line afoul of a log, and then good-bye, Mr. Salmon. But a master hand is guiding the canoe, and if skill and coolness will do it, we will kill that fish to-night. The salmon makes a rush under a log, of course; I immediately dip the point of the rod deep—down deep—and hold it there, while the reel revolves so rapidly that I know not whether the line is fast to the log or to the salmon. But Peter Barter is not idle; he has seized the pick pole and shoved the log away. Hurrah! the salmon has not fouled it, he is still there. Another log comes along, again down goes the tip of the rod, again Peter clears it, and now the salmon takes a swift run straight across the river, where there seem to be few or no logs. I am giving him the butt and recovering line rapidly, when Mr. Salmon turns and comes straight for the canoe—and, alas! a log does the same thing—and before we can stop it has lodged directly across the bow of the canoe, and Peter, with clenched teeth, is doing his best to dislodge it. One of the paddles now proceeds to drop overboard. I seize it with my left hand, all the time holding my rod in my right hand. We are drifting toward the rapids and things look blue. They would indeed have been indigo had the salmon taken a run, but he takes to sulking and we have stopped the canoe, and with a mighty push Peter sends that log free of us. "Aha, my lad, you didn't get us that time, did you?" And I say to the salmon, "Aha, my laddie, we are going to get you this time sure and certain." For the fish has begun to show the effect of the fight, and slowly I bring him toward the boat. Suddenly he quickens his motion, and toward the boat too—I shout, "Look out, Peter, he'll be under the boat, sure!" But not much, for Peter has his gaff ready, there is a rush and a splash and a struggle, for Peter has him hard and fast on the gaff—this struggling, thrashing mass of silver. Bang! and smash! over the side of the boat he comes. He is indeed ours. The scales are produced and he shows up just 40lbs.; the first fish for the season of 1896.

ROBT. C. LOWRY

RESTIGOUCHE SALMON.

DEE SIDE, Campbellton, N. B., Canada, June 5.—I came up to my old pools on May 25. Water fair, low if anything. Hauled ashore probably a dozen kelts. Just by way of getting my hand in I had one clean big fellow on the day I arrived, but he gave me the slip just as he was near the gaff. The first clean fish I got three days ago, a 30-pounder. Two next day of 27 and 24lbs. To-day, the morning's fishing, two of 18lbs. Our friend, Mr. Mitchell, was high line last Saturday; he got two fine fish on Friday afternoon and three on Saturday, one of them a 30lb. fish. I heard he had one blank day, yesterday. I had yesterday the worst luck I ever had salmon fishing, having no less than six fish on; two of them tore out when just ashore; two of them broke the leaders (poor stuff at \$2 each), and two hooks broke in the bend. I think the most of the fish were foul hooked. First run fish are commonly shy and hard to raise if one misses the first attempt.

I hear the nets in the bay and estuary never had such fishing; 100 fish to a net per tide is nothing extra, and they are selling at 8 cents a pound.

The forces are gathering for the fray rapidly. Some Montreal men have gone up. Messrs. Alcott and Lansing will be here to-morrow. Messrs. Breeze, White, Vanderbilt and others are here, getting fine fishing. There are many fish in the river, big fellows; it makes your arm ache before you land them.

The main drive of lumber to boom is now in progress, and there are only a few thousand cedar logs; they will be down in a week.

I have no doubt this is going to be the banner year on the old Restigouche. So far as I know any little bit of spare water is all occupied, and there is no chance to get at the river for a stranger, even edgeways.

JOHN MOWAT.

GOOD FISHING IN CANADA.

Editor Forest and Stream:

There is every reason to anticipate a successful season's salmon fishing in Canadian rivers. The heavy snows of March were followed by exceptionally high water, always a sure sign of an abundance of fish. And now comes a report from Tadoussac, at the mouth of the Saguenay, to the effect that salmon are running in such numbers right up into Tadoussac bay that boys are killing them with sticks where they are being left stranded by the falling tide. The anglers who visit the Marguerite and other tributaries of the Saguenay will have many to envy them this year.

During the whole of this week, fly-fishing for ouananiche has been exceptionally good at the mouth of the Ouatchouan, one boy taking five large fish and a 6lb. dory or pickerel on the fly in that pool in the course of an hour. The inhabitants about Lake St. John have been killing large quantities of ouananiche by bait fishing, and have been shipping the fish to Quebec, where it sells upon the markets for 15 cents per pound. For several days past the water in Lake St. John has been very rapidly falling, and I am now daily awaiting a telegraphic message from Roberval to say that the ouananiche are rising to the fly in *la grande décharge*. I believe that a few American anglers now fishing for trout between Quebec and Lake St. John intend going up to the lake by to-morrow (Saturday) night's train to enjoy the first fishing of the season in the Discharge. Whether they will find the fish there before them are not, it is certain that there will be good fly-fishing there by the time that these lines appear in print. Anglers on their way to those rapid waters should bear in mind to have some large salmon flies on No. 3 and 4 hooks for the June fishing in the Discharge. I would specially recommend Jock Scotts, silver doctors, professors, grizzly kings and brown hackles. Guides can be found in plenty on the steamboat landing at the head of the Discharge, after the crossing of the boat from Roberval.

Lake Edward has yielded some very heavy trout again this spring, and two or three different parties of Americans are encamped upon the shores of the lake and are enjoying good sport. In one of these are the Messrs. R. E. and William McCormick, of Florida, and their wives, and in another are Messrs. Nye, of Burlington, and J. W. Jones, of Clinton, N. Y. Some of their fish are 5½ and 5½lbs. each.

Judge Kellogg, of Waterbury, Conn., and a friend went up a few days ago to the club house of the Metabetchouan Fish and Game Club, at Kiskisink. The sport here has been very much so far as in former years, trout being very plentiful and running in weight from 1½lb. to 2½lbs. The monotony of fishing was varied there last week by the killing of a bear. Among those who have lately returned home from this preserve, well satisfied with the nature of their sport, may be mentioned Dr. Porter, of Bridgeport, Conn.; Mr. Wm. D. Bishop, of the same place, and Mr. Geo. A. Wilcox, of Meriden, Conn. Some rather heavy lakers (namaycush) have been taken in Lake Kiskisink this spring, one weighing slightly over 20lbs. A couple of small specimens, some 2½lbs. each in weight, were killed early in the season on the fly.

The members of the Triton Club have been very successful so far this spring, and a number of fish close upon 6lbs. each in weight have been killed in Lake Moise, Lake des Passes and the Moise and Lightning rivers. Among those who have enjoyed rare sport upon these waters during the past fortnight and have now gone home are Messrs. G. F. Gregory, Dr. H. F. Brown, H. E. Wannamaker, C. A. Andrews, Chas. Mowry, Denis McCarthy, Wilkin, Petit, Marsh, Pierce, Beebe and Lieut. Brewster, of Syracuse, N. Y. Another party, including Commander Henriquez, R. N., and Messrs. Clarence R. Dean, of New York; Walter J. Clemson, of Taunton, Mass.; Geo. Metcalfe and E. L. Wadsworth, of Erie, Pa., left for the Triton tract yesterday.

Governor W. E. Russell, of Massachusetts, along with Mr. B. F. Dutton and ladies, passed through here last Tuesday on their way to Little Pabos, Gaspé, salmon fishing.

A jolly party of anglers opened the season at Lac des Commissaires, on the Nomantum Club's preserve, on the 29th ult. It was headed by "Papa" Geo. E. Hart, of Waterbury, and Wallace Durand, of Newark, N. J., and they had for guest a Quebec newspaper man who will long remember the enjoyable time he had with them and the splendid fly-fishing at the dam. It was near the latter that the illustration of the guide netting one of Mr. Hart's monster trout was taken for the new book, "The

Ouananiche and its Canadian Environment." The party has since been joined at the club house by Mr. Brown, of Waterbury, president of the club; Mr. Bradley, of New Haven, and Messrs. Elton and Platt, of Waterbury.

E. T. D. CHAMBERS.

QUEBEC, June 5.

THE TROUT OF LAKE CRE CENT.—III.

I MADE more or less notes in regard to the fish we caught, and I will now refer to and shape them up, beginning with the

BLUE-BACK.—*Blue-back Trout*.—Lake Crescent, Washington. Specimen female; 28½ in. × 8 in.; weight 1½ lbs.

Body.—Short for weight; thick-set; short head, ova apparently not entirely developed; eggs about half size of salmon of same weight.

Back.—Deep indigo blue, deepest on back of head, where there are sprinkled many round black spots about the size of No. 4 shot. Gill covers smooth and pearly, free from spots. At about medium line the blue lightens into a pearly silvery tint which in the sunlight has an iridescent pinkish hue which is not visible in the shade. The belly is white.

Fins.—The caudal is nearly as square as that of a *fontinalis*, except at the center there is a small V-shaped notch; it and the dorsal fin are brown, profusely black-spotted. Pectorals, ventrals and anals nearly colorless, but with slight brownish hue. No spots and no border color on edges. There are eleven rays in the dorsal fin, thirteen in pectoral.

Flesh.—Uncooked, pale lemon color, bleaching to white when cooked; hard, firm and of most excellent flavor, in which the oily flavor of the salmon does not occur.

Scales.—Very large for a trout, small for a salmon of the size.

Habits.—I am told that it comes to the surface in spring, when it feeds on large white butterflies, then abundant; it does not leap for these, but will then take salmon or bass flies trolled slowly. In summer it seeks the deepest water and cannot be, or rather has not been, taken with fly or surface lure.

In fall we found it a deep-water fish, touching none of our surface lures; caught at depths of from 30 to 50 ft.; hard fighter when first hooked, boring and running deep; weakens as it nears surface, and is nearly exhausted when brought alongside. Specimens have been put alive in creek pools with other kinds; the next morning all alive except blue-backs, they always dead.

Now I am very anxious for more knowledge as to what is this trout. I made the great mistake of not sending one to Prof. Jordan, president of the Sandford University, who is the highest authority for the Salmonoidæ of the Pacific coast.

I did send him one of the photographs, but in the letter accompanying failed to inform him that the three smaller trout in the picture were not blue-backs.

He kindly answered my letter, and expressed a guarded opinion that they apparently most resembled the kamloops, recently described by him; but requires specimen before pronouncing positively. He sent me the description of kamloops, and between it and that of the Crescent Lake trout there are differences.

Coloration.

Kamloops.—Dark olive above, bright silvery below.

Crescent Lake.—Indigo blue above, silvery below.

Both are marked with a lateral band when fresh.

Kamloops.—Broad band, bright rose pink.

Crescent.—Broad band, rainbow hue.

Kamloops.—Back above, small black spots about size of pin heads irregularly scattered; more numerous posteriorly. A few faint spots on upper part of head.

Crescent.—No spots on back. Back of head profusely sprinkled with black spots size of No. 4 shot.

There are certainly strong points of resemblance, but the caudal fins differ greatly and the coloring some.

Kamloops.—Caudal fin distinctly although not strongly forked.

Crescent.—Nearly square, slightly lunated, with a V-shaped notch in center.

I have arranged, as early in spring as these trout can be taken, specimens shall be sent to Prof. Jordan, together with others of the various kinds in the lake.

The blue-backs are not the only trout found in these lakes, which apparently differ more or less from described varieties.

The following list of local names was obtained: Silver, speckled, mountain, cutthroats, Dolly Vardens, rainbows, blue-backs and half-breeds.

We caught only five of these varieties, viz.: first four and last two.

I took not very complete but accurate notes in regard to all of the kinds we caught, which I will give:

SPECKLED TROUT.—Lake Sutherland, Oct. 29.—Caught by Mr. Wilson, proprietor hotel: Length, 19½ in.; depth, 5 in.; weight, 4 lbs. Coloration: body, back dark brown with greenish tinge profusely sprinkled with round black spots about size of No. 6 shot, which continue to medium line; from this line, for nearly halfway to belly, black crescent-shaped spots which I think are composed of fine black spots. Back of head and opercles sprinkled with round spots like those on back. Belly silvery above, growing white below. Fins: caudal very nearly square; it and dorsal have many oval black spots on a dark-brown ground; these oval spots are also on ventral, pectoral and anal fins, which are very light brown tinged with red and bordered with orange color.

MOUNTAIN TROUT.—Lakes Crescent and Sutherland. Specimen: Length, 16 in.; weight, 22 oz. Coloration: dark brown above, silvery to white below. Fins: caudal quite forked; all above dark brown with black spots, lower fins light brown bordered with orange; no crescent-shaped spots.

SILVER TROUT.—Both lakes. Specimen male: Length, 13 in.; weight, 17 oz. Coloration: very light brown above, with purplish tinge growing lighter toward median line; then silvery to belly, which is white. The purplish tinge extends into the silvery part below median. Above this line the sides and back are profusely marked with fine black specks below the median, with crescent-shaped; just in rear of anal fin there is a small, dull, orange-colored transverse bar. Caudal fin very slightly forked; fins on back dark brown with black spots; lower fins light brown bordered with orange. This fish differs from the silver trout of Lake Tahoe and Truckee River in one point at least: these latter do not have the crescent-shaped markings, and their caudal fins are more distinctly forked than are those of the Olympian lakes.

HALF-BREED.—Lakes Crescent and Sutherland. Specimen: Length, 15 in.; weight, 18 oz. Sides and back dark green, brightest on back; many small black spots above, none below median line. Head long; gill covers pearly, no spots; tail quite square. Upper fins dark brown; lower, light brown, reddish tinge; all have spots; lower fins no bordering.

The lake people think this to be a cross between mountain and blue-back.

On the whole Lakes Crescent and Sutherland have given me the best trout fishing I ever enjoyed; they have enabled me to catch in one day more large trout than I ever saw caught, and among them the largest I ever saw.

Had my choice been hunting or shooting instead of fishing, the vicinity I have little doubt would have served me as well. Grouse were plentiful. To get a deer within a mile or two of the camp was almost a certainty, for they abound on the ridge which separates the lakes, and one of our party came back to an 8 o'clock breakfast with a fine young buck, and the hunting of it had a spice of excitement, for a bear—of which there are numbers—was encountered. And if my views soared higher I had but to accompany Ben on one of his trips to the elk benches, about eighteen hours' tramp higher up, and there was fair chance for me to participate in a successful elk hunt.

PISECO.

OUR HIRED MAN.

"GOIN' fishin', be ye. I had some good fun at it myself once, and enjoyed quite a reputation as a fisherman, I tell ye. No, I didn't catch trout nor perch nor horned pouts (same as they call bullheads about here); but I used ter get the biggest pickerel you ever see, and where the chaps with their fancy rods and spinnin' bait couldn't get one.

"It was at Bow Pond (Crescent Lake they call it now), right on a farm where I worked. There was big pickerel in the pond, but they was mighty shy and I wouldn't have got none if it hadn't been for a lucky idee.

"Before my time of workin' there they kep' a lot of geese on the place, but when Squire Locke died things got sort of run down about the farm, and when I come there was only an old gray gander left of the hull lot. The old lady didn't like dogs, and the live stock on the place was an old hoss, seven cows, three pigs, three cats and a lot of hens and the gander.

"The gander took notice of me right off and we got to be friends mighty soon, and he used ter foller me all over the farm. Abner was the name I giv' him, and whenever I was workin' Abner was sart'in to be close by and purty soon folks noticed it. 'How pleasant 'tis to see brotherin who agree,' Deacon Baker said when he saw us in the orchard. Miss Simpkins, the dressmaker, met us in the lane and she said, 'Birds of a feather flock together;' and folks would ask, 'How's Abner?' when I went to the post-office or store.

"One day, when I was workin' down by the pond, I see a feller in the little punt the Bailey boys owned, and he was flingin' his line away out on the pond and makin' it skip one side and t'other in little jerks till the hook was near the punt and then flingin' out ag'in. Abner didn't go inter the water, bein' generally shy of strangers, and both of us watched the chap.

"He kep' it up all the mornin', but didn't catch anything; then he come ashore and left. 'There's plenty of good ones in there,' he says to me, 'but they won't bite.' Soon's he'd gone Abner slipped inter the pond and went paddlin' about.

"While I was lookin' at him enjoyin' himself an idee came inter my head, and when me and Abner came back from dinner I had about 10 ft. of fishline and some bait. I tied the line to one of Abner's legs and hitched on a piece of twig near the hook so she'd float, and launched Abner inter the pond. He went a-sailin' away, and I noticed the line went by jerks over the water same as the fancy fisherman's did.

"Purty soon Abner giv' a squawk and made for shore, flappin' his wings and mighty scared. He landed in a hurry and made for me, draggin' a big pickerel arter him. He got over his fluster when he found he wasn't hurt, and arter a while I shoved him in ag'in. We kep' it up till he had landed five good ones and Abner got into the notion of the thing and seemed to like it.

"Arter that we catcthed 'em often and I got the name of bein' a great fisherman; and they would come to ask me about the right kind of bait, and the best way to handle the line, and the most sootable kind of weather and sich things. I couldn't tell 'em much and the less I said the cuter they thought me. But they didn't catch no fish. Ye see, the fish wasn't afraid of a gander; but was mighty shy of men, so Abner and me had the sport to ourselves, and whenever I got the chance and the coast was clear we'd go fishin'. As they say sometimes in stories, the futur' looked full of promise.

"But things is so onsart'in. One day when there was a fine drizzle and it was too wet to work, but jest right for fishin', me and Abner started for the pond and he was soon sailin' about in fine shape. I was a little oneasy when he went through a patch of lilypads, but he got along all right and passed 'em without the line git'in' catcthed. 'All's well,' says I to myself, and jest that minit I see Abner standin' on end squawkin and flappin' his wings, and then drawed down till half of him was under water. I put off in the punt jest in time to catch him by the neck and haul him aboard. There he was helpless and a pitiful objec' in the bottom of the punt, while I cut the line and tied it to a cleat and keerfully rowed to shore. Soon's I'd put Abner on the grass I hauled in the line, and on it the biggest mud-turkle I ever see—big, round as a bushel basket. Ye see, the pesky twig had got pulled off the line goin' through them 'tarnal lilypads, and the hook had sunk down to the bottom, where the turkle was a-lurkin'.

"I got \$3 for him, but what was that? Abner's leg was sprained and what was wuss, his nerve was gone. He made up with me all right in a few days, but he wouldn't go nigh that pond. When my work took me that way he'd stop short and look at me with his head bent to one side, and I soon see that our fishin' was done for. I couldn't keep up my reputation as a fisherman if I stayed there, so I left."

C.

The Nipigon.

PORT ARTHUR, Canada.—*Editor Forest and Stream*: Mr. Noble and Master Winch, two English tourists traveling around the world, stopped off at Nipigon on May 15 to fish the Nipigon River; they spent a week up the stream, but the water was too high for fishing; the trout would not rise to the fly. They caught a few fine trout with the minnow; the largest weighed 5 lbs. There were no black flies to bother them; the weather was fine and they had a pleasant trip.

J. E. N.

P. S.—There will be good fishing this month.

NEW ENGLAND ANGLERS.

BOSTON, June 8.—One has but to go to the Maine waters on a fishing trip at this season to be convinced of the importance of the rod and line sporting interest to everybody. About all the old standbys are going or have been there, and the increase is most remarkable. The Rangeleys are actually being overrun with tourist fishermen, though the fishermen of former years are not all taking that direction. At the Birches, Mooselucmaguntic Lake, a week ago Sunday night about forty guests were quartered, and prominent fishermen had to be turned away for want of room. The next day a still greater number were at Bemis to dinner. The New Rumford Falls & Rangeley Lakes Railroad is bringing crowds to Capt. Fred C. Barker's camps, and from that point they are being distributed over the lake region. As previously noted, all are not devotees of the rod and reel, though nearly all have an idea that fishing is the thing. Guests were found there from many States in the Union on the days noted above, though New England was largely in the lead.

The Col. Rockwell party has returned from Allerton Lodge, the pleasant camps of Messrs. Haskell and Andrews, senior proprietors of the Boston *Herald*. Fishing was fair, though the weather had been very windy, accompanied with a good deal of rain. Three handsome landlocked salmon were taken, Dr. Leonard being the happy captor of his share of them. One of the salmon was served at a dinner of the Boston Merchants' Club a day or two after.

The Camp Stewart Company had good success. Mr. H. S. Kempton was high line with a trout weighing 6½ lbs., which it took him forty-five minutes to bring to the net. Mr. C. A. Stearns followed him closely with a trout weighing 6½ lbs. Both were hooked the same afternoon. Mr. Stearns's reel gave out soon after his trout was hooked, and the big fellow had to be handled by drawing the line through the rod guides with the hand. It took a most an hour to land the fish. Mr. Geo. T. Freeman led in numbers, though no very large trout came to his creel. Somehow the ladies of the company, Mrs. Stearns and Mrs. Moody, were not as fortunate as usual, though taking a good many trout, but none of great size. Many small trout were returned to the water, nothing less than 1 lb. being retained. But all the time the larder was well supplied, with a good number to bring home to friends.

At the Upper Dam Hotel or camp, tacked on the walls under the piazzas, are diagrams of nearly forty trout, presumably truthful, and all taken within a year, generally the work of the season of 1896. No trout is posted weighing less than 4 lbs., and the weights run up to 6 lbs. It is doubtful if such another record is to be found in the whole world. About the best fish recorded were taken by the Ackerman party, of Brooklyn.

The Produce party is back in Boston again with reports of fair fishing. The weather was cold and windy a good deal of the time, however, a condition not favorable for trolling on a big lake like Moosehead. Often a lee shore had to be sought when it was fully intended to fish in another direction. Brook trout of fair size were taken and some big lakers. It is reported that one of the party got a laker of 17 lbs. weight. Mr. Dennen has a laker mounted, at the Kineo House, caught last winter through the ice, that weighed 29 lbs., I hear.

Messrs. Tallcot and Heintzleman are at Belgrade Ponds for black bass. Wm. B. Smart, First Assistant Assessor of the city of Boston, will go to Reddington, Me., this week for trout fishing and rest. He finds fine sport in that region. The narrow gauge Phillips & Rangeley Railroad passes some of the best trout brooks in that region, and is very accommodating about letting off and taking on sportsmen.

Mr. Mathew Luce is the champion catcher of codfish among the residents of the South Shore who make salt-water fishing a pastime. A week ago he landed eighty-two cod in a few hours' fishing, and on Wednesday last he took forty-seven. His fishing is done off Cohasset with a local fisherman who takes out parties. The fishing on Wednesday did not begin till 10 o'clock. In the wool trade Mr. Luce is called the champion fisherman as well as an expert in his own business.

The Col. Fuller fly, a new fly with yellow wings, red shoulders and bright gold body, is pleasing the black bass fishermen very much. Col. C. P. Fuller, the inventor of this fly, is now at Belgrade, and says that nearly all the bass he takes are on his fly. He has taken some of 2½ and even up to 4 lbs. He writes Mr. R. O. Harding that a native took a 4 lb. trout there the other day, and he learns that some of even 5 and 6 lbs. have been taken. He says that the natives took over 300 large trout from the Belgrade waters through the ice last winter. He is satisfied that the pickerel are being driven to their death by the bass. Commissioner Stanley is also satisfied as to the same point, especially in the ponds in Winthrop and Readfield. Mr. Fuller believes that the pickerel are doomed, and that with the proper protection, including the stopping of the fishing through the ice by the inhabitants of the State, the Belgrade, Winthrop and Readfield ponds will return to their former prestige of excellent trout ponds, as they were before the introduction of the deadly pickerel. Those bodies of water are said to have been once fully equal to the Rangeleys for trout.

Gardner Hammond, P. V. R. Ely and Dudley Fogg will leave for Belgrade ponds on Monday, for bass fishing.

Mr. C. Z. Bassett and Mr. G. W. Smalley are back from the Rangeleys, having had a very successful trip. They fished B Pond for a couple of days and landed a good many trout. Mr. Bassett's largest was 2½ lbs. on a fly. They also fished Kennebago and Kennebago Stream. Here Mr. Smalley took a very fine trout. While they were at the stream a landlocked salmon of about 3 lbs. was taken way up the stream from near the Broken Rock. This would suggest that the landlocked salmon are working up from Rangeley Lake. Mr. Bassett says that trout are being taken in Mooselucmaguntic and Cupsuptic lakes this season that are full of smelt, though no smelt have ever been put into those lakes. They must have worked down from Rangeley Lake, which has been stocked with smelt for the food of landlocked salmon. But it was not supposed that the trout would prefer these smelt to the minnows which are so very abundant in the Rangeleys. In the vicinity of Rangeley Lake there was a good deal of concern manifested among guides and others at finding a great many dead smelt along the shores of that lake. The suggestion is that some disease has broken out among them, but no one is at all certain yet. Mr. D. H. Blanchard

is now at Monson, Me., with his friend, C. P. Keeler. Both gentlemen will fish the Monson ponds for a week or more. On his return Mr. Blanchard will go to his salmon river.

Rangleys Lake is producing a remarkably large number of landlocked salmon this year, at least forty have already been taken; the largest, taken by W. F. Patten, weighed 10lbs. 12oz. Mr. Geo. A. Brackett, Jr., has been on a fishing trip to Dutton Pond, in Kingfield, and reports good fishing. Seventy-two trout was his record for a few hours' fishing, with the small ones all returned to the water. Mr. Joel A. Speary has been at Bemis, as usual. He was accompanied by Misses Effie and Annie Speary, who have greatly enjoyed the fishing. Mr. Speary has visited the Rangeleys almost every year for over twenty years, generally stopping at Bemis. But the fact of a railroad right into his former seclusion is almost too much. Though over 70 years of age, he is likely to seek other forest quiet away from the locomotive whistle. Mr. and Mrs. B. Shaw have returned from the Rangeleys. Mrs. Shaw secured a 5lb. trout.

SPECIAL.

While reports up to date from the Rangeleys, Moosehead and most of the other Maine lakes indicate exceptionally good fishing this season, the Boston men who have visited Sebago Lake bring back nothing but discouraging news of the fishing in that hitherto reliable body of water. With the exception of the first week's fishing very few salmon have been taken, although the lake has been trolled day after day. All agree that the fish are there. One gentleman tells me that the water is 8 or 10ft. higher than usual, but this is hard to believe, since we have had little or no rain for a long time; another places the blame on the weather, which he says has been too cold to permit good fishing. Still another says the smelt are so numerous that the salmon are gorged all the time, and to my mind the latter is the best explanation of all, although not accounting altogether for the phenomenon.

A letter of recent date from H. J. Wilson, of Moosehead, states that the fishing at the outlet at the foot of the lake has been wonderfully good during the last half of May. Many trout of from 4 to 6lbs. have been taken; not many places in Maine can show trout of such proportions.

For a long time Lake Winnepesaukee, in New Hampshire, has been a noted place for lake trout, but it has remained for the last two years to bring it into special notice as a place for salmon fishing. Many of the latter have been landed during May, and some of them have been heavy-weights. F. E. Busiel captured one of 9½lbs. and some others of less weight. A friend of Mr. Busiel has also taken a 9-pounder, and all indications point to the fact that it will be but a short time before Winnepesaukee will provide as good salmon fishing as Newfoundland or any of the lakes of the old Granite State. F. A. Hershey, with two or three Boston friends, have been up to Tufonboro Neck, at Winnepesaukee. They did fairly well, getting four lakere in two days' fishing, and then only after sinking to very deep water. Five pounds was the weight of the largest. H. W. Winter, just returned from Winnepesaukee with Robert Moses as guide, in two days' trolling between Meredith and the guide's camp on Horse Island; he landed twelve lake trout, the largest 5½lbs. and the smallest 4½lbs., and better still they were all taken on a 6oz. neverbreak rod. One fish was hooked very lightly in the skin over the eye, and when an attempt was made to net him the hook broke away. The prize was too exhausted, however, to get out of reach and a second attempt landed him in the boat.

Last year was the first experience in salmon fishing of Senator Proctor, of Vermont, and it only served to whet his ardor for the sport. He is now planning to go to the Miramichi and the Tobique, and I hope to get the story of the trip on his return. His fishing last year was confined to the pools of the New Brunswick Railroad Co. on the left branch and at the forks of the Tobique. He was on the river only two and one-half days, and probably fished not more than ten hours during that time, yet he landed eight salmon weighing from 15 to 22lbs. each. He is now a member of the Tobique Club, which has pools on the main stream and on the right branch. Senator Proctor likes to shoot as well as fish, and spent some time last autumn in hunting moose.

Another man of national prominence who likes salmon fishing is Justice Horace Gray, of the U. S. Supreme Court. Accompanied by his friend, Judge Robert Grant, of Boston, he will leave in a few days to spend some time on Judge Grant's river, the Metanne, in Quebec. Judge Gray had good fishing last season, and hopes to do equally well on this trip.

Archibald Mitchell passed through Boston a week ago en route to the Restigouche to fish the Grog Island pools. E. C. Fitch leaves soon for the Romaine. Mr. Fitch will be joined by Dr. Brown, who is now due to arrive home from Burmah, where he has been for some months. The two gentlemen will go to Quebec and sail in Mr. Fitch's vessel for the river. Charles D. Sias and George N. Talbot and one other gentleman start next Monday on a salmon fishing trip to the Gaspé, St. John River. W. M. Brackett, the artist, and Mrs. Brackett expect to leave on June 12 for Mr. Brackett's river, the northeast branch of the St. Marguerite. Mr. Harry Russell will join them on the 16th inst. At Bangor, E. A. Buck, of that city, has been having some good fishing. He has taken eight salmon within a week, four of which weighed 56lbs.

A Boston friend, who lately returned from one of the New Brunswick fishing preserves, tells me that in the St. Croix River, in the village of St. Stephen, N. B., while he was there the natives were taking salmon with the fly in the rifts below dam almost every day.

Mr. Louis Curtis and Geo. von L. Meyer, speaker of the Massachusetts House, will leave next week for the Restigouche salmon. Both had good fishing last season, Mr. Meyer landing eight fish in one day, which is something of a record even for the Restigouche.

The Aroostook region seems to be uppermost this year in the minds of many New England anglers as the promised land for fishing. Atkins Camp, at Oxbow, is probably the most prominent place in the region as yet, but a large number are planning to go further north, where there are many lakes in which it is said the best of fishing can be had. From what I have heard I think the camps over there, as compared with those of the Rangeley and Dead River country, are quite inferior in accommodations, but if they prove good centers for fishing these sins of omission will be forgiven, and it will not

take them long to improve. T. H. Rollinson and Mrs. Rollinson will leave on Sunday night for Ashland. They will go from there to Portage Lake and may extend the trip up Fish River to Fish Lake. Mr. Rollinson has heard great stories about the trout at Fish Lake.

Geo. L. Tracey and S. Y. Nash left on Friday night for Oxbow. They will spend two weeks at Atkins camp on the preserve, and fish around Milnocket Lake.

Another party just returned from Moosehead stopped at the Kineo House, and had the steamer Cora Lee when out trolling. On Wednesday last they landed fifty-five trout, weighing 150½lbs. These, of course, were mostly lakere, but Mr. Reding captured one square-tail of 5lbs. weight. They were fortunate in getting some fly-fishing during one day. A speckled trout weighing 3½lbs. and another of 1½lbs. were taken in one cast, and three casts yielded seven large trout. This was rapid fishing, and exciting enough to please any fly-caster.

Still another party just from Moosehead, with reports of good fishing, left on May 22, and, like most of the Moosehead anglers, had a steamer from which they fished. Their best luck was at the head of the lake, and among the fish taken were a few salmon. Mr. Cheney was high line of the party, getting one 16½lb. laker that took him forty minutes to land. Mr. Davis captured a 5½lb. brook trout, and Mr. Perkins a 13½lb. laker. Twenty-three fish were taken in one day, of which fifteen were speckled trout.

One of the largest parties of anglers that leave Boston annually for Maine is that headed by F. W. Thomas, of Boston. This is the fifth successive trip, and Moosehead Lake is the place. Last year they landed 383 fish, the largest weighing 14½lbs.

L. Dana Chapman, Horace S. Dame and W. A. Macleod have just returned from a trip over the Megantic Preserve. The party had good fishing, and found all the club camps in fine condition. They were gratified to learn that the salmon put in Big Island Pond were showing themselves and give every evidence of doing well. The return trip was made through Kennebago and down over the new road from Bemis.

HACKLE.

Niagara County Anglers' Club.

LOCKPORT, June 5.—The Niagara County Anglers' Club held their annual tournament at Olcott, on Lake Ontario, yesterday, and had a royal good time, as usual. The black bass were not biting, but many perch were captured. Yesterday was an ideal day for fishing. Never did the members of the Niagara County Anglers' Club and their friends have a better time. The fighting began at 9 o'clock in the morning and the fishermen were instructed to report at the pavilion at 5 o'clock in the afternoon. There were sixty-six anglers on each side, headed by Capt. W. W. Stevens (green) and Capt. W. F. Bennett (yellow). Several fished all the time, from start to finish, and were not seen until the roll was called in the afternoon. When their names were pronounced they would come forward with a large string of fish as a result of the day's sport. During the afternoon the fishermen gathered at the pavilion in little groups and discussed the events of the day. The refreshment committee was arrayed in proper uniform, and on their hats were the words "Life Saving Crew." Those who had charge of the refreshments had done their work well, and all were well cared for. The pavilion was filled to overflowing when the anglers congregated at 5 o'clock in the evening to have their fish counted and claim their prizes. The fish were laid on the floor and were carefully examined by the judges. The yellow side, under the able leadership of W. F. Bennett, was the winner by 373 points. The following is the result in detail:

Yellows—Perch 564, rock bass 41, white bass 11, black bass 1, bullhead 1, suckers 2; total 1,450. Greens (Capt. W. W. Stevens)—Perch 457, rock bass 23, white bass 4, sunfish 1, blue pike 1, eels 2, menhaden 1; total 1,077. Difference 373.

The fish schedule of the club is as follows: Black bass 50 points, white bass 15, salmon trout 100, muscalonge 500, pickerel 25, herring 5, yellow pike 20, blue pike 15, perch 2, rock bass 2, eel 20, catfish and bullhead 15, suckers 5, sheepshead 20, sunfish 1.

First prize, gold badge, for largest small-mouth black bass, won by T. H. Van Horn, who caught the only bass taken. Prize for largest string of perch by count, F. B. Lewis, with 43. For heaviest string of perch, H. J. Benedict. For heaviest string of mixed fish, J. F. Darrison. For largest string of fish by count, John Wilson, with 50. Heaviest string of white bass, W. Shaffer.

When the time of counting up came, the large string of fish which was brought to the pavilion by Ed. Le Van was nowhere to be found. It was rumored, and perhaps on good authority, that some person or persons had confiscated the fish, and that there was a fish supper held last evening. The persons who stole the fish were considerable enough to invite Mr. Le Van to partake of the meal.

Secretary Sweet proved an able officer, and did all in his power to have the fishermen enjoy themselves. Ex-Mayor John T. Darrison, who won the sixth prize for the largest string of mixed fish, caught five perch, four rock bass, one blue pike and one menhaden.

H.

A Very Useful Invention.

IOWA.—The drawing herewith is respectfully submitted as an invention very useful to the average fisherman, who never knows how big that big one was that got away, and how big a fight a fellow has on hand

when he has him hooked. We have several of the boys here who always come in ahead with a big one that got away, and this leads me to think that until the above is adopted there will be no show for the rest of us.

A. C. HEATH.

THE PROPAGATION OF SMALL-MOUTH BLACK BASS.

BY SEYMOUR BOWER.

[Read before the American Fisheries Society.]

At Cascade Springs, Kent county, near the banks of the Thornapple River, is located an experimental black bass station of the Michigan Fish Commission. The present is the third and most successful season of its operation. The water supply to the experimental ponds is derived from spring sources, not far removed, and is therefore too cold for bass work as it reaches the ponds, but the supply is so limited in volume that the area of pond exposure is sufficient to nearly equalize the temperature with that of the Thornapple River.

The Thornapple is well stocked with small mouth bass. Their spawning beds are found all along in front and for a considerable distance above and below our experimental ponds, thus affording an excellent opportunity, in connection with the pond work, of observing their natural spawning habits and the results.

This station was not established with any idea of permanency, nor with the expectation of hatching any considerable number of bass—the water supply is too limited for that—but rather to acquire practical knowledge by experience, experiment and observation, so that when funds are available for a large plant they may be expended wisely and efficiently.

Having no special fund for even experimental purposes, the work has necessarily been limited to a small scale of operations. In the summer of 1893 two ponds were excavated. The upper pond was to be used for experimenting in the direction of artificial propagation; the lower and much the larger pond was to be devoted to pond culture. During the fall a stock of about 150 adult bass was collected from the Thornapple and placed in these ponds. The fish carried well the following and subsequent winters, and also in the summer, although the temperature in the lower pond rises to 90° at times. No losses of any consequence have occurred, except as a result of handling during the spawning season.

In the larger pond the fish have not been disturbed during the breeding season. In the month of May, 1894, ten beds were made in this pond, from which 32,000 fry were taken as they rose in schools. This does not represent the number hatched, but the number saved, as a part of some of the schools had dispersed before it was discovered that they had risen.

The following spring, or one year ago, this pond was unproductive. Owing to extreme dry weather the supplying springs nearly failed at times, and the water in this pond became stagnant and quite foul and roily. When it cleared up a few beds were observed, and it is quite probable that a few fish spawned notwithstanding the unfavorable conditions; but if they did the beds were undoubtedly cleaned out by a large snapping turtle that was discovered in the ponds at the time. There is no doubt that turtles have a special fondness for the eggs and fry, as by actual observation two beds in the river are known to have been despoiled in this way.

The present season the shoal margin around the upper end of this pond is literally "peppered" with beds; and the outlook is most promising. There are sixty adult fish in the pond and eighteen beds are in sight. Five of these beds are non-productive, but the other thirteen will yield about 70,000 fry, 60,000 having already been collected from eleven of the thirteen beds.

The fish in the upper pond were reserved for experiments in the line of artificial propagation. Beginning with the first spawning season—1894—they were not disturbed until they had commenced to prepare the beds; they were then seined up from time to time and examined. Early in the season one ripe female was found and a portion of her eggs were taken, but there were no ripe males in the pond; so a male was opened, the spermaries removed and pressed out in water, which was poured over the eggs. Number of eggs taken, 2,100; number hatched, 700, or 33 per cent.

A number of the females were quite soft when first handled, but hardened up with further handling and failed to spawn at all. Bedding was also discontinued, and interference with the natural spawning was resented to the extent that they made no further effort to spawn in a natural way. Not a fish was hatched in the pond, and only 700 by artificial propagation. So this experiment was a failure.

A few days later a pair of bass were seined from their bed in the river as they were at the point of spawning, but no eggs or milt could be obtained. They were held in a tank seven days, then removed to a small pond with gravel bottom; but they made no effort to spawn, and finally fungused and died. Another pair was captured in the river while in the act of spawning, a few eggs having been cast; the eggs came freely, but as no milt could be pressed out only 500 were taken. By opening the male a very little milt was procured, and about 200 fish were hatched from the lot.

The next spring, or one year ago, a small side pond about 9×12ft. was excavated and connected by a short raceway with the pond in which the failure of the preceding year had occurred. This side pond carried only 18in. of water, a favorite depth selected by the fish in the river for spawning; and being much shoaler it would also grow much warmer, and therefore more attractive for the spawners, than its larger and deeper consort. The bottom was covered with gravel and small cobblestones and everything done to make the little annex as inviting as possible. No one but the attendants were allowed to approach the pond during the spawning season. A "blind" was provided near by, from behind which all the proceedings, from the initial step of preparing the beds to the final rising of the young fish, could be observed without intrusion.

The result more than justified expectations. There were no indications of bedding in the deeper pond, but in two instances at least the males literally fought over the possession of the bed in the little annex. Eight beds were made—there wasn't room for any more. Three pairs were lifted from the beds, of which one was spawning at the time, but, as usual, no milt could be pressed out, or only a minute "speck" or fraction of a drop.

No further effort to handle the spawners was made. As the last three pairs handled had not been touched or disturbed in any way or at any time until they were at the point or in the very act of spawning, we concluded that while occasionally, under peculiar or accidental conditions, a few eggs might be taken and fertilized, al-

efforts to reduce the business to a successful working basis would prove useless and futile; further experiments might be interesting, but would result in no practical benefit.

There is probably an appreciable space of time during which the spawn may be taken and fertilized, but this time is not known, and it would not be practical anyway to isolate each pair, as it would be necessary to do, and provide the constant surveillance necessary to insure seizing the opportunity. Moreover, it would be unwise to take the eggs artificially even if it were entirely practical to do so, as we could never hope to equal the natural hatching percentage. Given protection against turtles and water snakes—the male bass will take care of all other intruders—and the natural hatching percentage will often be as high as 90. Artificial manipulation of adhesive eggs has never reached that figure and probably never will.

Although to some extent a repetition of the above, I quote from my report in writing to the Board, filed shortly after the close of last season's bass work: "Previous experiments and a careful observation of the conduct of the parent fish prior to and during the act of spawning lead to the conclusion that the artificial taking and impregnation of bass eggs is possible only when undertaken at exactly the right moment, or within the limits of a period so brief as to admit of success only on rare occasions. A preliminary coaxing and caressing by the male seems imperative, not only to bring the female to the point of spawning, but also to develop the milt. These preliminary proceedings are sometimes carried on for several hours, and again for only a few moments; if interrupted or handled at this time, or prior to the orgasmic stage, neither the eggs nor milt will flow, so that artificial impregnation may be accomplished only during the few moments of actual spawning or after the natural spawning has begun. Under the strictest surveillance the opportunity is too seldom presented or known for practical operations in this direction. In any event, however, we would lose instead of gain by the artificial handling of bass eggs, owing to the relatively high percentage of natural results in protected ponds and the relatively low percentage of results by artificial treatment of adhesive eggs."

To refer back to the annex pond. After concluding to allow the natural spawning to proceed without interrupting, the fish continued bedding, and when the fry were nearly at the point of rising the fish that remained to guard the beds were driven out and the pond screened against the parent fish and to prevent the escape of the young. After rising and scattering they were scapped up as wanted for shipment. Total results of this pond for the season 16,000 fry, all taken from five beds, as three beds were unproductive.

This year there are eight beds in the annex and one in the connecting raceway. Six of these beds are now black with fry and will yield 20,000 to 30,000. There are thirty adult bass in the pond. The water is a little colder in this pond than in the lower one, hence the fry are a little later in rising.

The perfect success of the little side pond both last year and this indicates the style or system of ponds best adapted to the culture of small-mouth bass. The storage pond should be quite large and of good depth—say 4 to 8 or 10 ft. deep. Plenty of boulders should be provided for shade during the summer and to hover around, as the bass is wont to do while in the torpid condition of its winter retirement. This pond should have no gravelly shoals or margin to encourage bedding, but should be nearly surrounded with small ponds, each connected with the main pond by a short raceway, and made as inviting as possible for spawning purposes. No fear need be entertained that the fish will not seek the side ponds at the proper time. It is demonstrated that with a suitable water supply the question of propagating small-mouth bass on a scale to provide for large and effective distributions is reduced to the simple proposition of providing the ponds and breeders.

A few scattering notes in connection with the subject of bass propagation may be of interest and therefore are submitted.

In the Thornapple River the beds are made along the shores in from 1 to 3 ft. of water and where the current is very moderate—never in rapid water. A circular ridge of sand and gravel is thrown up and the bottom of the hollow thus formed—always of gravel and pebbles or small cobblestones—is swept bright and clean. This work is almost invariably done by the male, though in a few instances the female was present—which is not usual—and was seen to render some assistance, but this occurs only when the female is under great stress of haste to spawn. In such cases the preparation of the beds had been delayed too long, or they may have been driven from their own beds, duly prepared, by a pair whose bed had likewise been usurped.

Mr. Dwight Lydell, who is in charge of the bass work during the spawning season, and a careful and intelligent observer, was recently an eye-witness to an incident of this nature. While watching a pair of bass going through the preliminary maneuvering that precedes the actual spawning, another pair approached the bed with the evident intention of appropriating it. The males at once began a fight that grew quite furious at times and lasted about an hour. The females took no part, but rushed about in great apparent distress. The rightful owner of the bed, although much the smaller, proved the victor, for the would-be usurpers finally dropped down stream about 10 ft. and immediately commenced to whip out a bed of their own. They worked rapidly and in forty minutes the bed was ready. Then, after a few moments of sexual sparring, the spawning was begun and completed in five or six minutes. Meantime the other pair resumed business and in forty-five minutes had completed preliminaries and finished spawning.

The preparation of beds is usually begun in the latter part of April or early in May, though the spawning does not follow as a rule until several days later. This year the males began working on the beds in the annex pond on April 30; the first spawning there was on May 8. At the beginning of the season the males work on the beds only occasionally, and suspend work entirely during a cold storm or a spell of cold weather; but as the season advances matters are hastened and preliminaries shortened.

When the bed is ready and the male has induced a female to accompany him to it, there follows a series of movements quite impossible to describe. Generally the

female is coy and diffident at first and inclined to leave, but after much maneuvering and persuasion by the male is rounded up and reluctantly remains. The male grows more active and ardent; his movements indicate strong sexual excitement and a desire to induce excitement in the female; coaxing and caressing alternate with bunting and biting various parts of the body, but chiefly around the vent. Then the male glides slowly over the bed with a peculiar, trembling, fluttering movement while careened over nearly on his side. Soon the pair crosses the bed slowly, duplicating the spasmodic flutterings, each leaning over outward, thus bringing their vents close together, although the female is always slightly in advance. The bed is crossed in like manner at intervals of ten to twenty seconds until the spawn is all cast, which usually takes from five to ten minutes. The preliminaries that lead up to the spawning last much longer as a rule than the act of spawning, and sometimes fail altogether. In one instance a male was seen, after an hour's ineffectual effort to induce spawning, to drive the female back to the main pond and return in a short time with another. While the female is spawning the entire body is strongly mottled, but resumes its normal appearance soon after spawning and leaving the bed.

In a paper presented before this society at its seventeenth annual meeting, Mr. C. S. Holt stated that the male and female bass prepared the bed jointly, and that the female guards the young; but he has since acknowledged to me that later observations have convinced him that he was in error. It is positively known that, except under circumstances heretofore noted, the male bass assumes both of these duties. A number of fish have been captured while performing either function, and the identity of the sex established by removing the spermaries.

In size and color the eggs of the small-mouth bass correspond very closely with those of the fresh-water herring, being perhaps the least trifle smaller in size and a little deeper in color. They will approximate 80,000 to the quart.

The number of eggs per female will range from 2,000 to 10,000 or more. It is quite rare that so few as 1,000 fry rise from a bed, and as many as 8,000 have been taken from a single bed in the river, but 3,000 to 6,000 is the usual number.

The length of the hatching period, so far as observations have been made, varies from seventy hours at an average temperature of 60° to one hundred hours. A merely casual inspection will fail to detect the hatching point, as the fish at first is all sac, which is of the same size as the egg and looks just like it; but on closer examination it will be noticed that the sphere is slightly elongated and a very faint, shadowy line will be seen to extend about one-third the way around the sac. But the development is very rapid, and in from six to fourteen days, according to temperature conditions, "the sac that is all sac" has become a black, vigorous young fish. The black blanket of fry that now covers the bottom of the bed is ready to rise, and they begin to swim up and form a school which usually holds together two to four days, but may break up in two or three hours if the temperature is very high. On the other hand, the schools have been seen to settle back on the beds and remain a few days longer when there is a sudden and marked change to colder weather. They also usually settle back on the bed at night for the first two or three nights.

In the river the schools do not at first disperse in all directions; they head up stream, some barely holding even with the current, some dropping back, and others forging ahead and making some headway, thus gradually stringing along out in thinly scattered lines.

In addition to the small-mouth bass fry furnished by the Cascade ponds, 20,000 were collected from beds in the Thornapple during the season of 1894, 73,000 in the season of 1895 and 62,000 so far this season. We also collected and distributed last season 145,000 fry of big-mouth bass, all taken from beds around the margin of Laraway's Lake, near Cascade. So far this season 12,000 have been taken from the same lake. The beds of the big-mouth bass are found on and among the roots of pond lilies and various water plants and grasses.

Referring again to the pond feature of the present season's work, it should be noted that a total of ninety adult male and female bass in two ponds have so far produced 60,000 fry for shipment, with 30,000 to 40,000 more in sight.

ON A CONNECTICUT STREAM.

AFTER reading some of the accounts of excellent trout fishing indulged in by some of FOREST AND STREAM's correspondents, it would seem injudicious for a person to attempt to give a description of a trout fishing trip taken in Connecticut. As in other thickly populated sections of our country, Connecticut's trout streams are, virtually speaking, completely depleted. Scarce indeed are the streams accessible to the general public which afford any kind of a day's sport. To this order of things, however, there are a few exceptions. Happening to be one of the lucky ones who can take advantage of one of these exceptions, I occasionally manage to secure a few fish.

A quarter of a mile to the west of the farm on which I live, about halfway between the farm and a range of forest-crested ledges, is an extensive marsh, out of which flows a tiny, silvery stream of pure spring water. Fed by many tiny tributaries, as it advances on its southward journey, the stream gradually increases in volume until it assumes the proportions of a fair-sized trout stream. When it has left the marsh it flows, deep-voiced, over and against many boulders through a gloomy, forest-canopied cañon, from which it issues, dimpled and radiant, into a flower-strewn meadow. Gliding by dandelion-studded banks of emerald, or reflecting golden cowslips and slender anemones from some limpid pool, swirling swiftly under the upturned roots of a prostrate giant or bespraying a mossy rock or log, playing hide and seek with the sunbeams as it sweeps under drooping, verdant boughs, it glides and sings, smiles and frowns, twists and turns until its waters mingle with those of the Sound, ten miles to the south.

From the waters of the brook I occasionally manage to secure a fair string of trout. For the past three or four seasons, however, the fish have decreased in numbers to such an extent as to make us realize that we must restock it, or trout fishing in its waters will soon become a thing of the past. I fished it once this season, but met with such indifferent success as to cause me to lay my rod away for the rest of the season. I believe in giving them some chance.

It is of another and more successful occasion that I will try to give a description, the pleasantest and most successful day's trout fishing I ever had.

The apple trees hung under a smother of blossoms that morning, when, with a light rod in hand, I stepped forth from the side door of the old farmhouse and took my way across the fields toward the stream.

The sun had not yet risen when I reached the banks, though delicately tinted eastern heavens gave evidence of its early appearance. Every indication portended a perfect day—perhaps too bright a one for successful trout fishing.

I jointed my rod, and selecting a lively worm (I confess to never having been initiated into the graces of fly-casting) I baited the hook, then, drawing my hip boots well up, I cautiously stepped into the clear water.

The current had hardly carried the bait more than 20 ft. when there was a gleam like lightning, and as the line ran swiftly out I realized that I had hooked the first trout of the day. He proved to be an 8 in. fish. After admiring his bright spots I mercifully killed him and stored him away in the creel.

I unreeled about 25 ft. of line and continued cautiously on down the stream, allowing the bait to be carried into every nook and eddy. It was not long before I had another strike. This one, however, proved to be under the 6 in. limit, so I gave him liberty. Shortly after I came to a place where the stream, rushing down a steep incline, swept swiftly, though noiselessly, under the roots of an old stump that reared its black shape above a clustering bed of yellow dandelions. I had never sent my hook under this stump in vain. Approaching the spot with stealthy tread, I allowed the bait to be carried toward the roots. It had nearly reached the goal, when b-r-r-r went the reel; then like a meteor a dull gleam of gold flashed from out the shadowy depths under the stump. When I had given him plenty of time I struck, and soon I had a 10 in. beauty gasping on the bank. I took three more from this hole before they quit biting. One I returned on account of size.

I would like to put to the fishing contingent of FOREST AND STREAM what to me is a thorough conundrum: Suppose a fisherman who wishes to observe the law strictly should hook a trout under the size limit so badly as fatally to wound it, what is he to do? Should he return it in its mangled condition to the stream to die by inches or should he kill it and then return it to the stream, or would it be right to put it in his creel and take it home? This has always proved "a poser" to me. Possibly there are some who can enlighten me.

The dew jewels glowed in rainbow hues from every grass blade, leaf and petal under the slanting rays of old Sol as I went on down the stream. Slender anemones swayed gracefully in the soft morning air and the birds seemed to vie with each other in their sweetest carolings. "Surely this is living—this is freedom," thought I as I landed another spotted treasure among a bunch of bedewed cowslips off to one side of the brook. (I was thinking of myself at the time, not of the fish.)

I went on for a mile or so, when I arrived at a place where it is spanned by a log. A short distance below the log the stream widens out into a pool of quiet water. I generally count on taking a fish out of this pool, so I exercised the greatest caution in approaching it.

I had nearly reached a favorable position from which to manipulate my line when I was startled by a loud splash in the water behind me. Upon turning my head to observe the cause, imagine my surprise upon beholding a perfect whirlwind of arms, legs, whiskers and shower bath, all tangled up together under the log bridge in the middle of the brook. Floating with the current of the stream was a bundle wrapped in an old red bandanna handkerchief, a club and an old dilapidated stiff hat.

From out the depths of the whiskers, in a hoarse, buzz saw-like voice, there issued a succession of spluttering croaks intermingled with such a choice selection of sulphurous adjectives as to seem to cause even the birds to cease their warblings while they listened in dumbfounded amazement. Laying my rod on the bank, I gathered the floating articles together and carried them to their very much washed owner, who by this time had managed to scramble out of the brook, and who stood shivering on the bank.

Being considerably puzzled as to how to address him properly under the prevailing conditions, I suggested that the water in the brook was rather frigid to bathe in at that time of the year. That tramp didn't have a bit of fun in his composition, for he never smiled. Instead he glared in no assuring manner out of his small, bleared eyes at me, as he bent over and wrung the moisture from his water-soaked whiskers.

"D'ye t'ink I was fool enough fer to fall in fer fur?" he croaked fiercely. "Jest ez I put me fut on de t'ing it turned over wid me and trun me in de drink." I suggested to him that it would be a good idea to collect some wood for a fire, so as to dry his clothes. After assisting him with his fire I returned to my fishing.

He was the only tramp I ever saw in that neighborhood, and must have wandered considerably out of his course to have gotten there. The last glimpse I caught of him was when I entered the cañon through which the brook flows after leaving the marshy meadow. As he stood over the fire, with head drawn between his shoulders, his bedraggled black coat tails, hanging like a pair of drooping wings, gave him the appearance of nothing so much as that of a poor, forlorn crow.

When I had reached the cañon I had taken five trout. The largest measured 10 in., the smallest 7 in. The cañon is half a mile long, and is completely shaded by thick, heavy pines throughout its entire length. A number of holes are to be found in the brooks in this dark place, which afford excellent hiding places for the cunning trout.

Making my way cautiously over the slippery stones and taking a fish now and then, I finally reached a shallow spot where the water rushes noisily down an incline, then swirls sharply to the left and falls into a pool, under the roots of a huge oak, fully 5 ft. deep.

This is undoubtedly the best spot on the brook, and I was filled with pleasant anticipations as I approached it. Removing the old bait, I replaced it with a fresh lively one; then, crouching low, I worked carefully within the proper distance. Dropping the line into the water, the bait was soon swirled into the pool. It had no sooner reached there, however, than the line straightened with a sudden jerk and the reel began to sing. I felt satisfied that a good fish was at the baited end of the line before I struck. I was surprised at the result, however, when I

did strike, for it seemed for a time as if the dark waters of that hole had suddenly become filled with streaks of miniature lightning.

After that fish became thoroughly woke up I never expected to land him, but finally did. It was his own fault, however, for he swallowed not only the hook, but a good portion of the line as well. He proved to be the finest trout I had ever taken, and weighed just 1oz. under 1½lbs. I took one more out of this hole of about 1½lb. weight, and enticed six or eight more from their watery element before reaching the end of the cañon. Some under the limit I returned.

At the further end of the cañon I entered the open meadow beyond, selected a soft seat under the odorous, wide-spreading branches of a large apple tree and ate lunch. Then I spent an indolent hour lying under the tree. The low drone of insects mingling with the tinkling melody of the brook, the sweet blossom-scented air and the warm, bright sunshine caused such a languor to steal over my senses that I felt I would be contented to lie there forever. Using a much-quoted expression, surely "It is not all of fishing to fish;" for, as I lay with half-closed, dreaming eyes, there stole upon my drowsy vision, from out a distant frame of verdant boughs, the peaceful sight of one of those cradles of our nation's greatness, a small country schoolhouse. Floating from the white flagstaff and outlined against the azure sky, the clean stripes and blue, star-studded field of "Old Glory" rippled on the gentle breeze, and the far-away voices of happy, robust children at play under its protecting folds drifted on the air.

I emptied the creel and found that I had lured fourteen trout from their natural element. Considering the prevailing conditions of the weather, the day being perfectly clear, I had enjoyed unusual success for this section. While the trout in this brook are not numerous nor large (as they run), still their bright, gem-like markings and perfect contour of form cannot be excelled.

I had fished but a short distance from the apple tree when I arrived at a place where the stream, compressed between two ledges, narrows to a width of not over 2ft. The water rushes through this narrow sluiceway and falls a distance of 8 or 4ft., then tumbles and swirls over a boulder-strewn bottom for quite a stretch. Seven trout were induced to come forth from their boulder homes and join those already in the creel before I left the spot.

From here on I fished with varying reward through a succession of pleasant meadows and under drooping boughs, or lingered here and there to examine some strange flower, plant or other feature of nature. Call it selfishness or what you will, but it has always seemed to me that in order to thoroughly enjoy a day's trout fishing one should ally one's self as closely with nature as one can, and in no other manner can this be done so well as by being alone. A close communion with nature in my estimation is the principal essential of enjoyment to be obtained from a trip of this kind, so I almost always manage to be companionless on such an occasion.

Evening had spread her shadowy mantle over the eastern slopes of the semi-mountains in the west when I finally arrived at the road where my wife with the horse and buggy patiently awaited my coming. Her eyes grew large with surprise when she saw the thirty-two beauties that filled the creel, the result of the best day's trout fishing I ever enjoyed.

We drove home through a paradise of blossoms, which cast their delicious fragrance on the air. Just as we entered the door of the old farmhouse the weird gurgle of a screech owl welled from a nearby swamp to mingle with the first whippoorwill call, a greeting to the crescent moon that hung in the spangled heavens just above the rim of the low, shadowy mountains in the west.

WM. H. AVIS.

JUNE 2, 1896.

Round Mountain Lake.

EUSTIS, Me., June 1.—The Mohawk Fishing Club, a party of gentlemen from Boston and Haverhill, Mass., have been at Edgar Smith's Camps, at Round Mountain Lake for a ten days' outing, and found the fishing all that could be desired. They report fine catches on lake and streams, and seeing plenty of game.

One of their number succeeded in bringing down a fine bear. Three or four have been seen in the locality of Eustis and along the stage lines in the woods throughout the Dead River region. Sportsmen are wide awake now for such chances, and while bruin is lunching upon some poor unfortunate horse, victim of the winter's logging accidents, he needs to be on the alert for the jaws of a steel trap or a bullet from a .45-90 rifle in the hands of some patient yet ambitious sportsman.

Grouse are very plentiful and all signs point to lively hunting for the autumn. Deer are down from the heights and are coming into the lake at all hours of the day in large numbers.

J.

Forest and Stream Fishing Postals.

Drop us a line about the trout or bass, and where to take them.

MR. C. C. PETERSON, of the Big Fish, Machias and Pratt Lakes and Greenlaw Stream Camps, reached via Ashland, Me., writes us: "Mr. Eugene Delano and Mr. William Adams Brown arrived here May 23. In four days' fishing they caught fifty-two fish weighing 75lbs., ranging from 1½lb. to 8lbs. apiece. F. A. McNally and Ira McKay were guides, and your correspondent cook. They caught the greater part of them at Big Fish Lake.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

FIXTURES

BENCH SHOWS.

Sept. 7 to 11.—Rhode Island State Fair Association's fourth annual show, Providence, R. I.

Sept. 7 to 11.—Toronto Exhibition Association's eighth annual show, Toronto, Can. C. A. Stone, Sec'y of bench show.

Sept. 22 to 24.—Milwaukee Kennel and Pet Stock Association's second annual dog show, Milwaukee. W. W. Welch, Sec'y.

FIELD TRIALS.

Sept. 2.—Morris, Man.—Manitoba Field Trials Club. John Wootton, Sec'y.

Sept. 7.—Kennedy, Minn.—Continental Field Trial Club's chicken trials. P. T. Madison, Sec'y, Indianapolis, Ind.

Oct. 9.—Brunswick Fur Club's annual meet. Bradford S. Turpin, Sec'y.

Oct. 25.—Hempstead, L. I.—National Beagle Club's trials. Geo. W. Rogers, Sec'y, 250 W. Twenty-second street, New York.

Oct. 28.—Greene county, Pa.—The Monongahela Valley Game and Fish Protective Association's second annual trials. S. B. Cummings, Sec'y, Pittsburg.

Nov. 2.—Bicknell, Ind.—Continental Field Trial Club's quail trials. P. T. Madison, Sec'y.

Nov. 2.—Oxford, Mass.—New England Beagle Club's trials. W. S. Clark, Sec'y, Linden, Mass.

Nov. 10.—Columbus, Wis.—Northwestern Beagle Club's trials. Louis Steffen, Sec'y, Milwaukee.

Nov. 10.—Leamington, Ont.—Peninsular Field Trial Club, Leamington, Ont.

Nov. 16.—Newton, N. C.—E. F. T. Club's trials. S. C. Bradley, Sec'y, Greenfield Hill, Conn.

Nov. 17.—Chatham, Ont.—International Field Trial Club's trials. W. B. Wells, Sec'y, Chatham, Ont.

Nov. 23.—Newton, N. C.—U. S. F. T. Club's fall trials. W. B. Stafford, Sec'y.

FIELD TRIAL AND BENCH SHOW JUDGES.

NEW YORK.—*Editor Forest and Stream:* The recent carping on the bench show judges who acted in California and the many flings at field trial judges have set me to thinking, and while the impulse was on I thought I would write you a letter on this subject.

As to the California troubles now in ferment, it seems an amusing situation. It is only a year or two since California had any bench show dogs, and now her mushroom authorities have the audacity to set Mr. Mortimer right in his judging, and as proof positive of their correctness they cite the reversals of some of his awards by Mr. J. Otis Fellows. How amusing! Here in the East few of us would think that Mr. Mortimer was wrong because good "Uncle Dick" reversed him. We would rather think that Uncle Dick had blundered in that case. Mr. Mortimer is recognized as an all-round judge; Uncle Dick hardly such. It is with only the kindest feeling toward Uncle Dick that I say I believe that, set him to judge after any other judge and if he were judging a whole show, he would reverse anyone's judgments, be that one Mason or Raper or Mortimer. That Uncle Dick gave satisfaction is a pleasure to all; that his decisions are to be taken as conclusive in reversing Mr. Mortimer, no one this side of the Rocky Mountains will believe.

I observe with some regret that there is a disposition among a few to ascribe the decadence of field trials to the partiality of judges. It is true that the judges have been the cause of much discontent. They have unkindly awarded prizes many times contrary to the opinions of owners. That is an error of judgment. No prizes should be awarded without the concurrence of the owners. There then would be no "kicking," and consequently that great affliction, the "kicker," would not harm field trials.

It occurred to me to ask who the judges are and who they were. I could learn by examination whether the characters of the men are such as to sustain the suspicion of incompetency. At my request a friend made out a list for me, which I now use. He got it largely from Major Taylor's book. It will, I think, do much to silence groundless complaint.

The first field trials were in 1874, held by the Tennessee Sportsmen's Association, and had for judges J. W. Burton and J. H. Acklen. These gentlemen retired on their first honors.

In the Association's second trial, 1875, the judges were Messrs. El. Orgill, W. A. Williams, Luther Adams and E. C. Sterling, all men of high standing in the business and social world. In 1876, same Association, the judges were Messrs. E. Orgill, J. H. Whitman, Col. James Gordon (Pious Jeems) and Major J. M. Taylor.

In 1877, at the Hampton, Ia., trials, the judges were Messrs. John E. Long, Henry Miller and H. J. Edwards. The Association's trials at Memphis same year were judged by Messrs. D. C. Bergundthal, Gen. Jackson and Dr. J. B. Alexander. The next year Gen. Jackson, Gen. Churchill and Dr. Rawlings Young officiated.

At the trials of 1879 in the National American Kennel Club's trials and the Eastern Field Trial Club's trials the judging was performed by Capt. Pat Henry, Messrs. Theodore Morford, J. N. Patterson, W. A. Coster, T. F. Anderson, C. Du Bois Wagstaff and L. G. Billings.

In 1880 trials began to multiply and the judges' list grew accordingly. There were chicken trials and quail trials. In the former were Mr. B. E. B. Kennedy and Gen. R. R. Livingstone. In the quail trials with judges already enumerated appeared Mr. Justus von Lengerke.

In 1881 in the chicken trials were Dr. J. I. Leas, J. D. Brown and E. Perrine. On the California coast were C. Robinson, H. H. Briggs and D. M. Pyle. Mr. T. F. Taylor made his debut in the East that year, Mr. E. A. Spooner taking his place later in the stake. The same names heretofore enumerated appear often in different events in later years, so I will only mention the list of new ones as they appeared year by year.

In 1881 Judge J. M. Thompson, judge in the Circuit Court of Louisiana; Messrs. F. Marion Backston, B. F. Wilson, J. H. Dew, Capt. A. E. Woodson, William Tallman.

In 1882 J. D. Brown, B. Waters, J. M. Kinney, Elliot Smith, H. D. Polhemous, Judge C. E. Pratt, Capt. W. H. Key and N. D. Wallace.

In 1883, Messrs. Luther Adams, J. Otto Donner, D. S. W. Bridges, Judge C. E. Pratt, F. W. Dunn, Dr. William Jarvis, J. M. Trezevant, N. B. Nesbitt.

In 1884, Messrs. C. Fred Crawford, F. A. Diffenderfer, L. C. Bruce, Geo. W. Wingate, Jacob Pentz, C. F. Lewis, H. C. Brown, A. G. Pratt, Thos. Bennett, J. T. Baker, F. I. Stone, Judge Joseph McKenna and M. S. Humphreys.

In 1885, Messrs. John W. Munson, W. B. Stafford, W. E. Leavitt, Chas. Heath, F. R. Hitchcock, C. N. Post, J.

G. Edwards, John W. Prescott, P. J. Shafter, J. M. Barney, Judge John Clegg.

In 1886, J. M. Avent, A. Merriman, A. A. Whipple, C. J. Peshall, Percy C. Ohl, Col. B. Ridgway, J. W. Orth, C. W. Paris, Col. W. E. Hughes, Hon. R. T. Hailey, Fred A. Taft, Hon. D. M. Pyle.

In 1887, Dr. Otto Moebes, W. B. Wells, P. T. Madison, C. Munhall, S. H. Socwell, J. M. Freeman, Theo. Mosher, Louis Kunz, R. C. Van Horn, A. P. Vredenburg, S. L. Boggs, H. B. Duryea, T. M. Brumby, H. M. Markley, John H. Gilbert.

In 1888, Hon. John B. Clegg, L. B. Baynard, C. D. Kretz, Amory R. Starr, Col. A. G. Sloo, E. Schultz, Royal Robinson, J. R. Henrichs, Dr. R. I. Hampton, T. L. Martin, Prof. W. W. Legare, B. P. Holliday, R. L. McCook.

In 1889, R. T. Vandevort, I. N. Aldrich, P. J. Shafter, R. T. Hailey, F. Y. Hall, R. W. Shaw, John Davidson, L. E. Wells, Benson Mann, Pierre Lorillard, Jr., N. Wallace, Col. W. C. Sherrod.

In 1890, W. L. Thomas, Thomas Johnson, William M. Kerr, G. D. Jay, Dr. J. B. Alexander, L. H. Smith, J. L. Nichols, S. C. Bradley, J. M. Tracy.

In 1891, Norvin T. Harris, J. K. Renaud, R. L. Foster, Dr. John Clegg, Omer Villeré, W. C. Nelson, Dr. M. F. Rogers, W. J. Wolz, W. J. Rosborough, Jr., R. P. Littlejohn, S. W. Trott, Luke White, J. B. Stoddard, Herbert Merriam.

Since 1891 there have appeared Rev. W. Hamilton Spence, W. S. Bell, J. King, W. W. Titus, P. H. Bryson, W. A. Thompson, G. T. Guttridge, W. T. Tristram, A. M. Young, B. M. Stephenson, John Bolus, John Barker, Capt. C. E. McMurdo, A. R. Sharpe, J. W. Lawson and a few others whose names I cannot now recall.

In the list are millionaires, divines, military men, lawyers, business men of high standing in every way, of the best material that the land affords, and yet there is an unreasoning claim for better judges. Who are they and where?

The grim rider has removed several since field trials began. Of these are B. F. Wilson, Pittsburg; J. M. Freeman, Bicknell, Ind.; R. C. Van Horn, Kansas City; N. D. Wallace, New Orleans; J. M. Tracy, New York; H. D. Polhemous.

There is much of the peevish, the sulky, the false in the claim that field trials owe any loss to the inadequacy of the judges.

FIELD TRIALER.

DOG AND PICTURE.

PHILADELPHIA.—*Editor Forest and Stream:* The Rev. Charles Josiah Adams's most interesting description of the dog's objective and subjective cognizance, published in FOREST AND STREAM of May 30, recalls to my mind somewhat similar circumstances which came under my own observation some years ago. The circumstance of the dog and the looking-glass were identical. The dog was a mongrel bull terrier, not openly quarrelsome, but boldly inquisitive and ill-tempered toward other dogs. A looking-glass was placed in front of him one day, and he exhibited the most intense curiosity. He walked up to the glass, put his nose on it, then as if to surprise his bold interloper he suddenly sprang behind the glass and there was visible a look of dismay or mystification at the nothingness of his efforts. He repeated the action two or three times, then gave it up as something uncanny or partaking of the nature of black art. He felt he was ridiculous, being the subject of much amusement, but I could not perceive that he ever discerned that the counterfeit presentment was his own reflection. He saw what to him was a dog, and being absolutely unable to find the intruder he desisted from further attempts.

There is no doubt but what the dog is a keen observer of emotion. He can read his master's expression of countenance much better than he can understand his words. But that he can distinguish portraits never occurred to me. I imagine that the dog's powers in that direction are exceedingly limited and not common to the multitude. Probably some dogs of exceptionally high intelligence and exceptionally favorable opportunities may do so. No doubt the skill of the artist too was above the ordinary, for it is very difficult for a man to recognize the portrait of his best friend as it betimes comes from the hands of some artists. In the instance brought forward the skill of the artist must have been more extraordinary than the perceptive faculties of the dog. On this point, speaking in a more serious vein, I think an isolated incident should not be taken as proving that such high perception is common to the whole race of dogs. This is a point on which the observations of your numerous readers would be invaluable in establishing whether the dog's cognition is of such a high order that he really recognized a portrait, or that he considered the portrait as being his master in his own proper person. If he mistook the portrait for his master, he simply betrayed stupidity, for the skill of the artist simply deceived the dog. In other words, the dog did not recognize any portrait; he recognized only his master himself from a false cognition. There was thus no real perception of a portrait or picture as such. He was deceived into thinking he saw his master. There was no discrimination exercised. It was as if all the while he were actually looking at his master. There was no separation of identity; there was no recognition of the portrait as a portrait. To the dog it was all reality. At least, so it seems to me, and I do not think Rev. Mr. Adams has made it clear that it is otherwise, although such may be from not elaborating on this point so fully as it deserves, and so fully as I know he is capable of doing.

A POSTERIORI.

Pointer Club Meeting.

A REGULAR meeting of the governors of the Pointer Club of America was held on June 3, at the office of Mr. James L. Anthony, New York. The vice-president presided. Present: Messrs. Odell, Mortimer, Lewis, Jarvis and Anthony. The secretary being absent, Mr. Lewis was appointed secretary *pro tem*.

The vice-president reported that owing to the inability of Mr. Gould to meet the committee on field trials and Mr. Webster's absence on jury duty, he being also one of the field trial committee, the committee was unable to make a complete report at this meeting, and suggested that when this meeting adjourned it shall do so for two weeks, and meet at the same place and hour to receive said report. On motion of Mr. Jarvis, seconded by Col. Odell, it was moved that the report of the committee shall

be accepted and the meeting be held by them as suggested, two weeks from June 3. The following new members were elected: Thomas Watts, Middletown, N. Y.; Dr. Wesley Mills, Montreal, Canada; James F. Crane, Dayton, Ohio; D. S. Gregory, New York; W. F. Owens, New York; W. P. Taber, Long Branch City, N. J.; G. W. Amery, Boston, Mass.; George Crocker, New York; J. D. James, New York; H. F. Farnham, Portland, Me.; T. H. Gibbs, Columbia, S. C.; J. B. Lincoln, M. D., Tyrone, Pa.; J. E. Whiteselle, Corsicana, Tex.; Charles Daly, Guelph, Canada; W. W. Davenport, Somerville, N. J.; Frank Pidgeon, Saugerties, N. Y.; Louis Bätjer, Elizabeth, N. J.; E. M. Beale, Louisburg, Pa.; Frank G. Eaton, Centre Barnstead, N. H.; E. D. Stocker, Cooperstown, N. Y. The meeting adjourned to meet on June 17, at 3 P. M., at Mr. Anthony's office.

The Whirligig of Time.

THE procession in the kennel world is a bit straggling, but the stragglers are improving in pace and courage. In regard to the harm which might follow from handlers being club members, the following references will explain themselves, though it may be explained that in 1894 the position was very unpopular, while time has so irrefutably demonstrated the soundness of FOREST AND STREAM's position that there is perfect safety now in adopting it.

FOREST AND STREAM, Jan. 6, 1894. American Field, May 23, 1896. A factor that will tend to restore confidence and bring about harmony is not to allow one or two handlers to have a voice in the management of the club's affairs. If one is allowed this privilege, then all must be allowed, and this latter being impossible, therefore the former is the only practical remedy. When one handler has a voice in directing the club's affairs it creates a suspicion that the dissatisfied handler or owner takes up and magnifies, and in a short time this suspicion spread over the entire guild, whether there is any foundation or not for it. Who would back a horse, or what amateur would enter a horse in a race where the rules were drafted by a board of governors made up in part of the jockeys who were to ride in competition to a finish, or have a voice in selecting the judges?

All handlers might not do so; in fact, I know some whom I firmly believe would not. But whether they would or not, the principle is wrong. It is an injustice to other handlers who are not club members to compete with a handler who is a club member. The handler-member has a voice in all the club affairs. He can be heard on the amount and conditions of the purses, the time and place where the trials will be held, the rules under which they will be run, the stakes, who will be judges, etc. Other handlers, who are not members, of course have no voice in such matters. Thus there is the incongruity of a competitor in a public stake competing under conditions which he had a part in arranging, while other competitors had no such part. That is not just in principle. Members who are interested from love of sport are thus brought in contact with members who are interested for business reasons.

It is the same old professionalism appearing in another form. Among club members, whose interest is in promoting sport, it is sure to be as disastrous in the end as it is to the amateur in competition. The best business interests of the handler in his capacity as a competitor for the club's prizes are not the club's best interests as a promoter and supporter of sport and the best advancement of the dog.

Manitoba Trials and Free Customs.

MANITOU, Man., June 3.—*Editor Forest and Stream:* I have much pleasure to inform you the Manitoba Field Trials Club have made arrangements with the customs by which all dogs that are duly entered in either the club's Derby or All-Aged stakes coming from the United States will be given free entry, the only condition being that they must be returned to the United States within the space of three months.

The club will appoint a customs broker in Winnipeg to pass all entries.

A circular giving full instructions will be mailed to all owners and handlers making entries.

JOHN WOOTTON, Sec'y-Treas.

POINTS AND FLUSHES.

F. A. Stuhr, of Portland, Ore., is the owner of a baby seal that has the strangest foster-mother that ever a seal had. It is nothing else than a beautiful curly-haired retriever dog, named Belle, that has taken a strange fancy to the little ocean waif, and is giving it that nourishment that it denies its own offspring. When Mr. Stuhr received the little fellow last Monday, from one of the collectors whom he employs to gather specimens for his collection, it was not more than a day and a half old. Mr. Stuhr at first did not know what to do with the little fellow. From certain indications, he saw that the seal was only a few hours old. He first tried to feed it with fish, but the seal was too young to eat. Then he tried it with a bottle to which a rubber nipple was attached, but met with no better success. By this time the seal was getting hungry, for it had had nothing to eat in twenty-four hours, and its owner was afraid it was going to starve to death, when Belle, the retriever, attracted by the persistent bellowing of the hungry little animal, left her litter of pups, to see what was the matter with the strange object that was squirming around in the middle of the floor. No sooner had the dog come near enough to the little seal than it began to flop feebly in her direction. The dog stood still, and quietly watched the stranger approach her, until it was so near that it began to lift its little head, and then something about the baby seal must have appealed to her mother's heart, for she lay down and began to nurse the little one as though it was the most natural thing in the world to do. The dog will

nurse the seal for hours at a time, and only when it has had enough and has fallen asleep does she venture to leave her charge. Should the little fellow wake up and find its foster-mother gone, it flops around the store and bellows for her until she returns.—*Portland Oregonian.*

A singular case is recorded in the *Kennel Gazette*, of Lieutenant-Colonel Cornwall Legh's well-known pointer bitch Gladys, having swallowed, presumably with food sent down from High Legh Hall, a skewer 4½ in. long, two years ago, and no ill effects having resulted until the end of last month, when Mr. Meech, Colonel Legh's trusted kennel manager, noticed what at first he thought to be a broken rib protruding from the bitch's side, but what turned out to be the skewer in question forcing its way through the skin. Mr. Meech, by the aid of a pair of pincers, successfully performed the operation of pulling the skewer out of the dog's side, and it now lies at the Kennel Club office as a relic of this singular accident. What makes the case all the more remarkable is the fact that in the interim the bitch has brought forth a litter of no less than ten healthy puppies, to Mr. Street's (late Mr. Hignett's) well-known dog, Kirksanton Brocket (K. C. S. B.).—*Our Dogs.*

A meeting of the Metropolitan Kennel Club will be held on Thursday of this week, at the Garden Hotel, 63 Madison ave., New York. Business of importance will be considered.

The programme of the All-Aged Stake of the Continental Field Trials Club's second annual quail trials is announced in our business columns this week. The purse is \$750, pointers and setters running together. Messrs. Royal Robinson and W. S. Bell will adjudicate.

At Aldridge's, St. Martin's Lane, London, on Friday, July 3, there will be sold twenty setters, four pointers and one retriever, the property of A. P. Heywood-Lonsdale, Esq. It will be remembered that Mr. Lonsdale sent dogs twice to this country to compete in the trials, the veteran, Mr. William Brailsford, Ightfield, Whitchurch, Salop, England, having them in charge.

Mr. George Bell requests us to mention that his address while abroad will be 34 Cross street, Manchester, England. Cable address, Bell, Brawney, Manchester.

KENNEL NOTES.

Kennel Notes are inserted without charge; and blanks (furnished free) will be sent to any address. Prepared Blanks sent free on application.

NAMES CLAIMED.

Auburn Cocker Kennels claim the names
Ebony Prince, Jr., for black cocker dog, whelped May 15, by Ebony Prince—Toledo Duchess.
Ebony Ted, for black dog, same litter.
Ebony Pluto, for black dog, same litter.
Ebony Grand Duke, for black dog, same litter.
Ebony Dude, for black dog, same litter.
Ebony Princess, for black bitch, same litter.
Ebony Beauty, for black bitch, same litter.

BRED.

Mr. F. H. Lindsay's Miss Forest, fox terrier bitch, April 10, to Wawaset Royal.
Mr. J. M. Chaplin's Rose, fox terrier bitch, April 7, to Wawaset Royal.
Mr. J. F. Belt's Wawaset Lucy, fox terrier bitch, April 23, to Prisoner.
Mr. B. S. Horne's
Warren Damsen, fox terrier bitch, April 2, to Prisoner.
Tambourine, fox terrier bitch, Feb. 25, to Prisoner.

WHELPED.

Mr. B. S. Horne's Tambourine, fox terrier bitch, whelped, April 26, four (one dog), by Prisoner.
Mr. M. J. Flaherty's Florence, English setter bitch, whelped, April 23, three bitches, by Mowatt.
Wanoosnac Gordon Kennels' (Leominster, Mass.) Esta Morse, Gordon setter bitch, whelped, Feb. 3, eleven (nine dogs), by champion Ranger B.
Auburn Cocker Kennels' Toledo Duchess, cocker bitch, whelped, May 15, seven (five dogs), by Ebony Prince.
Mr. W. H. Reddick's Signet Gladstone, English setter bitch, whelped, May 16, five (two dogs), by Parker's Rod.

SALES.

Mr. M. J. Flaherty has sold Pendennis, English setter dog, to Mr. A. S. Saagy.
Dr. Wesley Mills has sold Count Leo, Gordon setter dog, to Dr. D. S. Woodworth.
Wanoosnac Gordon Kennels, Leominster, Mass., have sold
_____, Gordon setter dog, to Mr. Clarence Reid.
_____, Gordon setter dog, to Mr. Willis Haynes.
_____, Gordon setter dog, to Mr. Fred Trumbull.
_____, Gordon setter dog, to Mr. Chas. Marshall.
_____, Gordon setter dog, to Mr. Alvah Stowell.
_____, Gordon setter bitch, to Mr. Smith Finney.
_____, Gordon setter dog, to Dr. D. S. Woodworth.
_____, Gordon setter dog, to Dr. Henry Wheeler.
Nola, Gordon setter bitch, to Lawn Gordon Setter Kennels.
Mr. B. S. Horne has sold Ramona, fox terrier bitch, to Mr. Robert A. Welch.
Mr. Wm. Loeffler has sold
Maximilian, dachshund dog, to Mr. John Boyd Thatcher.
Sandy, dachshund dog, to Mr. Irving Johnson.
Nora, dachshund bitch, to Mrs. Edith Riggs.
Black Girl, dachshund bitch, to Mr. Chas. T. Limberg.
Milwaukee Boy, dachshund dog, to Mr. W. F. Brummer.
Lisette, dachshund bitch, to Mr. W. F. Brummer.
Gretchen L., dachshund bitch, to Mr. Jas. R. Walker.
Floss, dachshund bitch, to Mr. Ph. Koenig.
Wilhelm Meister, dachshund dog, to Dr. Wuerdemann.
Pedro L., dachshund dog, to Mr. G. M. Mashek.
Loreley, dachshund bitch, to Dr. Wuerdemann.
Helene, dachshund bitch, to Mr. Wm. Uihleint.
Jolly, dachshund dog, to Mr. Jos. T. Leimert.
Snap, dachshund dog, to Mr. F. Nethe.
Zigzag, dachshund dog, to Mr. Geo. W. Kronshage.
Moses, dachshund dog, to Mr. E. J. Weiser.
Florence, dachshund bitch, to Mr. A. Beckman.
Tilly L., dachshund bitch, to Mr. Chas. T. Limberg.
Mr. J. Danforth Bush has sold _____, bull dog, to Mr. John Coles.

OCTOBER.

3. Cor. Atlantic City, mosquito class, Atlantic City.

To ALL appearances the system of starting signals and numbers established by the Y. R. U. will be a success and do much to prevent the confusion that has always reigned in yacht racing under a different rule for each club. There are, however, several points where improvement may still be made. In regard to starting, the custom in England and America differs materially; in England a yacht race always starts on time; in America it never does, but there is always a delay, awaiting the club steamer, or the judges' tug, or the ice cream, or some prominent yachtsman whose entry is desired, but has not seen fit to rise in season to reach the starting station by the advertised time. This being the case, another signal is very much needed, a preliminary signal that shall indicate that the preparatory gun will be fired within a short time. As matters are now, the best yachtsmen, the prompt ones, are at the line at the advertised hour, on the slender chance of a punctual start. No preparatory is given and they sail about, often for an hour or two, with no definite idea of when a start will be made. It often happens that when the preparatory signal is given they are at a considerable distance, possibly missing the signal entirely, or else failing to catch the gun in time to set the watch for a close start at gun-fire. All that is needed is a signal, such as a number of long blasts from the judges' steamer and the display of some flag, to indicate that the time of postponement is at an end, that yachts shall approach the line and watch for the true preparatory signal, which will follow in perhaps not more than ten minutes. Such a signal can easily be given, and should be demanded by the racing rules.

Another small but important point is the marking of the starting line, which in this country is invariably done by two marks or mark boats in the water, one at each end of the actual line crossed by the yachts. On British courses the starting line is, if at all possible, marked by a shore range as well as by the two marks in the water. No man, however expert, can tell to a certainty just when his yacht is on or over a line between two marks, one on each side of him; but with a shore range he can approach the line as closely as he pleases and yet feel sure he is not on it when the gun fires. Such a range can in many cases be established without difficulty by the erection of two flagpoles on the shore; if painted white these should be visible against most backgrounds.

The racing number and class letter promise to become accepted institutions, as they are not only a necessity to the spectator and the newspaper men—on whom the racing yachtsmen presumably rely for correct reports of the races—but to the latter themselves, as indicating just who their competitors may be. Thus far several difficulties have presented themselves in the way of a thoroughly satisfactory system of numbering. One of these is the common objection of racing men to accept numbers large enough to be visible outside of the yachts themselves; the owners of yachts of 30 to 50 ft. in some cases refusing to take numbers hardly large enough for 15-footers on the plea that they were too large. Another difficulty is in the placing of the numbers, usually close in by the mast and as low down as possible, and thus hidden by the round of the luff. Still another that may be noticed this season in the smaller boats with very light sails is the blurring of the number on one side of the sail by the back of the number on the other side, which shows through the thin fabric; the number is thus made indistinguishable save at short range.

Where permanent numbers are used, as in the Y. R. U., the best solution of all these difficulties is the painting of a number, in figures and letters of reasonable size, on the sail itself in the proper position, near the peak. This can be done so that the two sets of numbers will not overlap and show through. There would be no objection possible on the plea of weight or windage of the numbers, the only objection would be the possible permanent disfigurement of the sail. Another plan, that we have more than once advocated in the past, is to adopt three or four standard sizes for the material on which the numbers are to be painted, and to have each sailmaker provide himself with a set of the standards in the form of light wooden templets, with grommet holes marked in the corners and if necessary along the sides. When a sail is made the sailmaker will mark off the holes and set the grommets, locating the number where it should be, in the peak of the mainsail; and the cloths on which the numbers are painted, and which should be of some opaque material, will be made with holes marked from these same templets. In setting the two numbers it will only be necessary to lace or tie through the grommet holes in the numbers and the sail. The numbers may be quickly removed, and they will, when in place, be held snugger and with less danger of getting adrift than if put on with pins.

It is all very well to say that not only the race committee but every competent yachting reporter should know the yachts at sight; but the printed entry lists are necessarily unreliable, yachts which are entered do not always start, and others start without being entered in time to be named in the list. Out of some forty or fifty yachts some changes of rig, color or shape are certain to turn up, especially in the first races of the year, which confuse the most expert, and it is necessary both for the committee and the reporters to identify a yacht at the first glance, picking up another as soon as the name of the first is hastily jotted down.

In the Knickerbocker Y. C. race of Saturday the 30-footer Vaquero III. was distinguishable from the other two—none of the numbers being visible at a comparatively short distance—by the fact that she followed the English fashion and carried her racing flag on a light staff above the main truck. In this case of course it was the different position of the flag which identified the yacht; but more than this, while the flags of the other two were saugly curled up under the leach of the mainsails, secure from public view save on certain occasions, that of Vaquero III. stood out boldly and plainly at all times, high above the yacht and visible from the entire horizon. If a racing flag

is of any practical use, it must be placed where it will be always visible, and the peak of the mainsail is about the worst place on the yacht. A racing flag of sufficient size and appropriate design, some simple combination of two or three colors and not the crazy-quilt patterns of monograms, initials or heraldic crests so often seen, and displayed from the truck, serves not only to identify a yacht, but to set off, with its bit of bright color, the whole structure of bright yellow spars and white canvas.

YACHT DESIGNING.—X.

BY W. P. STEPHENS.

(Continued from page 443, May 30.)

We have thus far dealt with the yacht as she presents herself to the eye on the stocks or the railway, a solid body of extremely complicated form. Such a conception as this, while a true one in its way, is entirely valueless for the purposes of the designer; the most that it gives is a picture or a series of pictures of parts of the vessel which cannot be accurately measured and which disclose few or none of the essential elements. Beautiful as they may be, the finest drawings or photographs of a yacht out of water or under sail are useless compared with the complicated tangle of plain black lines that represents so much to the initiated and so very little to the novice. In order to grasp the work in a practical way the designer is forced to abandon the artistic and to adopt the conventional and prosaic methods of mechanical drawing. A thorough knowledge of the science of descriptive geometry must be set down as the foundation of the education of the designer, as through it he acquires that training of mind and eye that enables him to see the lines on a flat sheet of paper standing out in the curved form of the model. In default of such complete knowledge, however, the beginner must content himself with a knowledge of the leading principles of the science, leaving it to time and practice to acquire the desired proficiency.

Descriptive geometry is that branch of mathematics which treats of the graphic representation of all geometrical magnitudes (lines, surfaces and solids), and also of the problems relating to these magnitudes in space. The various divisions of the science are: orthographic projection proper, the basis of all mechanical, architectural and marine drafting; spherical projection, the basis of map and chart making; shades and shadows; perspective, the basis of free-hand drawing, also used to a certain extent in architectural drafting; and isometric projection, a minor branch of mechanical and architectural drafting. The drafting of war and merchant vessels, especially the older types, with their grotesque sterns and eccentricities of form—and in particular where the use of wood made the employment of cant frames a necessity—involves some complicated problems of descriptive geometry; but the drafting of yachts, especially the more modern models, is a comparatively simple branch of the subject, less difficult and complicated by far than in other mechanic arts, such as masonry, stairbuilding and sheet metal working. The principles themselves are simple and not difficult of comprehension; the main difficulty for the learner lies in the method of their application; if the work is not done carefully and systematically from the start, more or less confusion must ensue from the large number of lines and points employed. At present we shall deal only with the essential principles, but when we come to their application in the every-day work over the drawing table we shall endeavor to set forth such a systematic course of operations as may simplify the drawing and lessen the chances of error.

The portrayal of an object as it actually appears to the eye is a comparatively simple matter, but such a drawing can give no exact information as to sizes and relations of parts; it cannot be measured, and is of no use for purposes of exact construction. For all the purposes of the mechanic arts the picture must be abandoned in favor of a conventional drawing which often fails to convey any idea to the uninitiated, but at the same time is full of meaning to the experienced workman. The making of such drawings of vessels is a very essential part of the designer's work, but it is in no sense the whole of designing.

We have in Fig. 11 a solid of the simplest form, an oblong and rectangular block of wood. While the picture indicates the nature and proportions of the object, it gives

FIG. 11.

no definite idea that would enable us to construct another of the same size. In order to obtain something exact and definite the draftsman is compelled to abandon the real and to enter the domain of the imaginary. In the upper part of Fig. 12 we have the solid drawn in perspective, A B C D, E F G H. Let us conceive of this solid as suspended in a glass box, V U Y W, Z T O X. Now, if we can apply a plumb line to the vertical edge of the block, A F, we will find that it touches the bottom of the box at f; and similarly the upper end of the line will touch the top of the box at a. By applying the plumb line in turn to the other three vertical edges of the block we obtain three more points on the bottom, e, g, h, and three on the top, d, c, b, and we then have the exact outline of the bottom of the block on the bottom of the box in e, f, g, h, and of the top of the block on the top of the box. Now we can take a straightedge and apply it to the long upper edge of the block, A B, obtaining points, a and b, on each end of the box; and by the same process applied to the other three long edges, we can obtain the exact outline of each end of the block on the corresponding end of the box; as at a, d, e, f, b, c, g, h. Now, by the same process the two sides of the block may be projected on the sides of the box.

There is nothing specially complicated or difficult about this process, which will evidently give us the exact outlines of each side of the block, from which measurements may be taken and another block made. The only difficulty for the beginner lies in the lack of that mental training that should enable him at once to see, in place of the tangled and confused lines on the flat surface of the paper, a mental image of the solid block surrounded

by the glass box. The expert draftsman, in examining such designs of yachts as appear from week to week in our pages, sees, not the black lines on the printed page, but a solid body, equivalent to the wood model or the yacht herself out of water. This power of eye and mind to work together in the creation of the imaginary solid from the actual flat surface is acquired in time through practice in marine drafting alone; but the best means to it is through the study of descriptive geometry and the solution of its problems. It will require some effort on the part of one unfamiliar with drafting and projection to understand the various lines in Fig. 12. The rectangle W V Z T represents the front end of

FIG. 12.

the glass box, toward the draftsman, and Y U X O represents the rear end, at the back of the picture. The lines W Y, V U, Z O and T X represent the four long edges of the box. The vertical edge V T is nearest to the draftsman, and the other vertical edge Y O is the furthest from him. The heavy lines show the inclosed block, suspended midway between the two sides of the box, but nearer the top and front end. It will be evident on careful inspection that the drawing may be read in two ways: one as just described, with the end W V T Z toward the draftsman; and the other exactly the reverse, with the end Y U Z O facing him and the block inclined the other way.

Suppose that in place of the block and the glass box we take a yacht on the dry dock, as in Fig. 13. We may start with the same process of projection by means of the plumb line. If we walk slowly around the deck from stem to transom and drop the line from the rail at inter-

FIG. 13.

vals of a few feet, we shall get on the level floor of the dock an exact counterpart of the half breadth of the yacht at the rail. If we apply the plumb line in the same way along the waterline, as marked by paint or by the usual discoloration, we shall obtain the duplicate on the floor. We can then go further and obtain the half breadth of the bottom of keel and possibly at the rabbet.

Now we can take a long straightedge, and with proper appliances to hold it both level and square to the fore and aft line of the keel we can project on the side of the dock the outline of the top of rail, stem, keel, rudder and counter, as well as the rabbet line. We can also project the waterline, which will evidently be a straight line on

FIG. 14.

the side of the dock. We may in this way go a little further, and if the dock is closed at one end we can project the greatest cross section of the yacht upon it. This, however, is as far as we can go by the simple method which was fully adequate for the delineation of the plain

block of wood, but which fails to cover such a complicated form as a yacht.

In the case of the simpler forms made up of plane or flat surfaces, the projection of the various straight lines forming the edges is not a very difficult matter, but with a solid bounded by curved surfaces, such as a yacht, this primitive method is inadequate. There are few positive lines, perhaps even none at all, but only the unbroken surface. Every surface, however, is made up of an infinite number of small points, and if we can lay off a certain number of these points and locate them on the sides of the surrounding box we shall have a satisfactory representation of the object. Referring to Fig. 12, the point A, one of the corners of the solid, is located by six separate measurements, one from each side of the surrounding box, as Af from the bottom, Aa from the top, Ad' from the left side, etc. Now it is evident that if we

FIG. 15.

have the distance Af above the bottom of the box the height of A is positively located and the measurement Aa useless. Similarly the point is located laterally by the distance Ad', from the left side of the box, and the distance Aa' is useless. We may then discard entirely three sides of the box, the top, the front end toward the draftsman and the right side. This is actually done in orthographic projection, the object to be drawn is considered as situated in the angle between three planes, one below it, one at the left side and one at the back, as in Fig. 14. The point P is assumed to be suspended in space in a position with reference to the bottom which is measured by the line PA, through the point and perpendicular to or at right angles with the lower plane. Its distance from the side plane is measured by another perpendicular, PC, to that plane, and from the rear or end plane by the distance PB. It is evident that no further measurements are necessary, but the point is fully and definitely located.

Now we may drop entirely our simile of a box and adopt the terms of descriptive geometry, as used by every draftsman. The three sides which we have retained are known as the *coordinate planes*, *planes of reference*, or *planes of projection*; the object being referred to them or projected or thrown upon them. The perpendicular to a plane of projection through any point, as PA, is called a *projecting line*, and the foot of this line, where it intersects the plane, as at A, is called the *projection* of the point on the given plane. In Fig. 15 we have the same point, P, and also two others, Q and R. It is evident that any two points must mark the end of some straight line, and any three points must be on some line, straight or curved. As we have already seen, a *plane*, as the term is

FIG. 16.

applied in descriptive geometry, is merely a flat surface, such as the three planes of projection, originally the sides of our glass box. The simplest conception of a plane is that of a sheet of glass of indefinite extent, through which everything is visible. In Fig. 15 the points, Q, P, R, are assumed to be each equally distant from the bottom and side planes, and consequently they mark a straight line, QPR. The projections of the points on the lower plane, q, p, r, must also mark a straight line, parallel to the side plane. Now, if we imagine a plane to pass through the line QPR and perpendicular to the lower plane of projection, the three projecting lines, Qq, Rr, and Ss, will also lie in this plane. The line of intersection of this new plane with the lower plane of projection, q, p, r, will be the projection of the original line, QPR. This line of intersection of an auxiliary plane with one of the planes of projection is called the *trace* of the plane; and, similarly, if the line QPR be continued until it intersects the end plane at S, the point S is called the *trace* of the line. The vertical line Ss is also the *trace* of the auxiliary plane on the end plane.

These auxiliary planes are of the utmost importance in marine drafting. In the drawing of buildings or machinery there are many prominent and definite lines and angles which may be directly projected upon one or another of the planes of projection, but a vessel offers little save an unbroken curved surface, devoid of all lines. It is by the application of these imaginary planes to this surface that the draftsman is enabled to cut from it any lines which he may require, just as they might be cut from the wooden model with a saw. If it were desirable to obtain from a wooden block model the various waterlines, it would only be necessary to adjust the model on the table of a circular saw and to cut it into a number of slices of the requisite thickness, from each of which the outline of a waterline could be drawn direct on the paper.

This process, in fact, is very commonly followed in working from a wooden model, the model being made of a number of thin pieces of board, called *lifts*, united by screws; when the model is completed the screws are removed, the lifts separated and the outline of each drawn on paper. By this process the model is practically destroyed in order to obtain any one set of lines; it might be glued up again and sawn transversely instead of longitudinally to obtain the lines that make up the body plan, but

FIG. 17.

it would then be past all use and another model would be necessary to obtain the section lines and diagonals. This same process of sawing into sections and marking the outline of each can be done even more readily and accurately by the use of auxiliary planes on the drawing than by actually sawing up the wooden model, and it is essential that the young designer should become thoroughly familiar with the projection of points and lines and the passing of planes through them.

In Fig. 16 is shown a curved line, RSTUV, lying parallel to the lower plane and with its concave side toward the side plane. Being thus parallel to the lower plane, its projections on the side and end planes are neces-

FIG. 18.

sarily straight lines, as r'v'. The projection on the lower plane is a curved line passing through the feet of all the different projecting lines, Rr, Ss, Tt, Uu, Vv.

In Fig. 17 the same curved line is shown, at the same distance from the side plane; but inclined at an angle, a'r'a, to the horizontal plane. The horizontal projection of the line will now be Rstuv, a different curve, the distances Rr', Ss', etc., still being the same; but the distances measured along the side plane being shorter, as r'w is shorter than r's', etc. To obtain the horizontal projection of the line in its true form, a process termed *rabatting* is employed. This is merely the revolving or hinging of the original plane in which the line lies, indicated by its traces, r'a', a'b', about some line as an axis until it takes

FIG. 19.

the position shown in Fig. 16, parallel to the lower plane. We will conceive of the plane r'a', a'b', as revolving about the line Rr' until it reaches the position r'ab, each point of the line, as S, describing an arc of a circle about the line Rr'. Each point on the line is now in the same position as in Fig. 16, and may be projected directly on the horizontal plane, giving the points S'T'U'V', the broken line through them and R' being the required true horizontal projection of the line.

In Fig. 18 we have the original block, its sides lying parallel to the planes of projection, as in Fig. 11. In all of the figures, from 11 to 18, it has been necessary to show the three planes and the various objects in *perspective*, in order that the reader might see them as he would such

a model as is sometimes constructed of cardboard and threads in order to illustrate the subject. Our aim, however, is not perspective, but plain orthographic projection such as is employed by the marine draftsman. In Fig. 18 the solid block is shown, with its three projections on the different planes. Let us now assume that the block itself is removed entirely and the three planes of projection are so folded back as to present a single plane surface instead of an angle. This will give us Fig. 19, the ordinary drawing of the machinist, architect or designer.

The horizontal plane, once the bottom of our glass box, and on which is projected the bottom of the object, is called the *ground plan* in ordinary mechanical and architectural drawing, but is known to the designer as the *half-breadth plan*, its various lines showing the breadths of one of the two symmetrical halves of the vessel. The drawing above it, once the left side of the box, is the *side elevation*, or in designing the *sheer plan*, as it shows the sheer or line of the top of rail or deck, the contour of stem, keel, stern and rudder, and the centerboard if there be one. The drawing on the right, the rear end of the box, is the *end elevation*, or to the designer the *body plan*, and it shows the transverse sections of the yacht, equivalent to the ribs. As will appear later, the front end of the box is used indirectly; and in some cases, as in the roof plan in an architectural drawing, and in fact the deck plan in a yacht, it may be assumed that the projection is made upward on the top instead of downward on the bottom of the glass box; but even though other planes of projection may be used at times for special reasons, it is sufficient for the draftsman, and far simpler, to consider only the three thus far described.

The 15ft. Class.

EVERY day brings news of new boats for the 15ft. class, and there can be no question that a most interesting fleet of these little flyers will shortly be afloat. The main question now is how soon will the majority of them be ready, and how many will show up at the line by June 22, but two weeks off. Nearly all of the boats are intended for the trial races of the Seawanhaka C. Y. C., but it is quite evident that many of them, if nominally ready, will still be very far from complete or in fair racing trim. Among those now on the stocks is one at Bay Ridge, built by some of Mumm's boatbuilders from the design of Chas. Olmstead, designer of Trilby, a fin-keel of similar model, 5ft. 6in. beam; the hull is single-skinned with smooth lap planking, and the deck is canvased. Over at Communipaw A. Hansen has on the stocks a 15-footer from their own designs for the Ball brothers, who sailed Ethelwynn last year. She will be of the skipjack variety, with sloop rig.

No prize has yet been offered for the worst freak in the class, but such a contest might be exciting, even if not instructive or otherwise useful, as there are at least two boats on the stocks which will be in every way eligible to compete. One of these is building by T. W. Webber, of New Rochelle, for Hazen Morse; and the other for T. F. Day, of The Rudder, was designed by the Crosby Catboat and Yacht Building Co., of Fifty-sixth street, Bay Ridge. Both of these boats embody the same idea, of a double hull, or more properly of two boats in one, the lower one for measurement and the upper one for actual sailing. The Crosby boat is 24ft. over all by about 6ft. beam, the midship section being a V of rather more depth than in most of this class. The sternpost is well under the boat and is plumb; from the heel the keel rounds down and then up forward to the waterline, from which it turns sharply and runs along parallel with the water and an inch or two above it. The designed length on waterline is to be 10ft., which will allow a sail plan of 400sq. ft. The midship section is a fair and continuous line from rabbet to planksheer, but the sheer plan presents the appearance of a boat 10ft. over all, with plumb sternpost and a deeply immersed rudder; on top of this boat being another 23ft. over all, and with a very slight rocker to the keel. The boat will have a wooden centerboard of the old style. It is proposed to have her trim so that with the required weight of 300lbs. of lead aboard to represent the crew she will measure but 10ft. on the waterline; but with the regular crew and the boat under way she will in reality sail on a very much greater length and possess the power of a 20-footer, carrying the same sail plan. Just how all this is to happen we do not understand, and we see several practical difficulties in the way. However, the success of the experiment will soon be put to a practical test. Still another 15-footer is building at Bergen Point by Mr. Walter Brown for his brother, W. F. Brown, owner of Crocodile, from a model by Philip Elsworth.

In addition to Mr. Morse's boat, Webber is building another for a member of the Westchester Country Club.

Mr. Clapham, at Roslyn, has two more under way: one of the barn-door type, for a member of the New York C. C., and another, an improved Imp, for a member of the New York Y. C.

American Model Y. C.

BROOKLYN—NEW YORK BAY.

Saturday, May 30.

THE opening races of the American Model Y. C. from off the new salt-water station was somewhat marred by the few starters and a half a day lost in measuring all the 17 yachts that proposed to start, but did not come to time. The new measuring tank not being in proper condition for accurate measurements, only approximate measurements were taken by measurer Nichols, who will have to go through the same performance when the tank is properly adjusted.

Four yachts came to the line for the first class. A great deal was expected of the Ripple, but owing to her peculiar steering gear she could not keep up with the other yachts down wind, they using the ordinary automatic steering gear. She finally gave up racing for the day. Mary Alida was unfortunate after finishing the first heat outside the flags by getting away from her owner and running under the nose of a large sloop yacht lying at anchor, making a complete wreck of her mast and rigging, therefore not being able to start in the other heat.

The third class resolved itself into a very pretty race between Minerva and Ida May, Minerva eventually winning after a stubborn fight.

The second class did not fill, the rules calling for three yachts or no race, and only two showing up, the same being the case with the schooner class.

A S.W. to W. wind blew all day, fluctuating from 3 to 6 miles per hour, with a moderate sea on.

FIRST HEAT—FIRST CLASS SLOOPS.

	Start.	Elapsed.	Corrected.
Mary Alida, Jos. Brown.....	1 51 25	Outside.	
Kittie D., H. V. Davis.....	1 50 18	0 16 15	0 16. 43½
Ripple, L. R. Thurlow.....	1 51 03	Did not finish.	
Edith, Neff & Pigott.....	1 49 20	0 14 00	0 13 29½
Henrietta, J. D. Casey.....	1 51 10	Fouled.	

SECOND HEAT.

Kittie D.....	2 19 02	0 16 33	0 17 51½
Edith.....	2 17 26	0 15 14	0 14 42½
Henrietta.....	2 17 17	0 17 15	0 15 20¾

FIRST HEAT—THIRD CLASS SLOOPS.

Minerva, J. D. Casey.....	3 23 40	0 22 00	0 23 39
Dolce, E. Autenen.....	3 24 55	Did not finish.	
Ida May, Neff & Pigott.....	3 24 51	Did not finish.	

SECOND HEAT.

Minerva.....	3 57 28	0 15 17	0 15 16
Dolce.....	3 57 33	Outside.	
Ida May.....	3 56 50	0 13 43	0 14 16

THIRD HEAT.

Minerva.....	4 21 05	0 12 43	0 12 42
Ida May.....	4 20 38	0 13 05	0 13 05

Edith wins in first class sloops, first heat, by 3m. 14s.; second heat and race by 3½s.

Minerva wins in third class sloops, first heat, by walkover; third heat and race by 23s.

Cape Cod Y. C.

EAST DENNIS—BARNSTABLE BAY.

Saturday, June 6.

The first race of the Cape Cod Y. C., on June 6, was sailed over two rounds of the five-mile course, the times being:

	Length.	Elapsed.	Corrected.

Judges—F. M. Crewell J. W. Smalley, D. Shiverick.			

American and British Steam Yachts.

BATH, Me., May 29.—*Editor Forest and Stream:* Under ordinary circumstances I am opposed to any newspaper controversy, but your reply to my letter of May 9 certainly demands of me another letter.

You acknowledge that Eleanor's performance on her cruise around the world was excellent. I will go further still and say that it stands unequalled to-day by any vessel of her class. As I understand your reply, you also agree with me as regards the workmanship and accommodations of the yacht, but the point we apparently cannot agree on is her appearance, which you claim is decidedly unyachtlike.

I have not had the opportunity of seeing Eleanor since she arrived in New London after having successfully circumnavigated the globe, and therefore I know not how much she has deteriorated in appearance, but I speak of her as she was when she left her builders in 1893. At that time she was the handsomest steam yacht that I had ever seen. Her neat sheer and handsome bow and stern were admired by all, and the vessel in all particulars, appearance, arrangement and detail, represented a decided advance in steam yacht architecture, not only in our own country, but also in Europe. Your remark that she is from ten to twenty years behind time as regards appearance is certainly erroneous and needs no comment.

You are fixing the standard of steam yacht appearance on your own ideas and taste, but you must remember that in this particular people differ greatly in their opinions, and no such standard can be placed that will suit all classes. What you consider pleasing to the eye, graceful and yachtlike, another person might think directly the reverse. Not even the best educated experts can agree on this subject.

Most yachtsmen were very enthusiastic over the appearance of Eleanor, and when Peregrine was being designed Mr. R. H. White desired that a sheer and ends somewhat similar to Eleanor's should be given her. The designer must necessarily cater somewhat to the tastes of the owner, and if a naval architect can design steam yachts that please their owners as far as appearance is concerned it matters not if they do fall short of any one person's ideas of symmetry and proportion, for it is a fact that no designer can please all. In large steam yachts especially the design is often handicapped by whims of the owner.

According to your editorials the British steam yacht is perfection as regards appearance, while the American yacht is beneath comparison. To me one of the most gratifying features concerning American shipbuilding is that our designers and builders seek to produce something original, or at any rate something different from the usual British practice. They are working on different lines, and are trying to avoid the bow and stern that so characterizes a British steam yacht. Apparently you like the ends of a British yacht, and because Americans don't follow suit and build precisely the same thing you condemn their appearance. There are many experts and yachtsmen in this country whose opinions are just the reverse to yours on this point.

Excepting a slight difference in the sheer and a number of minor details, the representative British steam yacht of to-day is precisely the same as ten or fifteen years ago, and I myself cannot see where they progress. There is a great similarity between British steam yachts. Almost all have the same ends and general appearance, so that you can readily distinguish them in any fleet.

Judging from your article you term all the J. Beavor Webb designed yachts "British," so in that case he cannot have become an American citizen. This takes from our list of American yachts Sultana, Intrepid, Utawana and Corsair. Of these Sultana is generally regarded as the best looking, but the rig of the three former (they being auxiliaries) has something repulsive looking and very unyachtlike about it. Moreover, the yachts, especially Intrepid, I am informed, lack the ability to carry the canvas given them.

The St. Clare Byrne yachts are Namouna, Alva, Valiant and more recently Arcturus. These yachts probably conform with some people's ideas of what a yacht should be, but the most expensive of all, the sumptuously furnished Valiant, cannot be termed handsome or yachtlike. Neither could Alva, and even Namouna has a heavy, clumsy look about her.

I acknowledge a certain handsome appearance of the British yachts Rona, Sapphire, Valhalla, etc., but I cannot say the same of such boats as Giralda, Sylvia, Hermione, etc.

Now, as regards American steam yachts, outside of Eleanor, Peregrine and Ilawarra, I think the following boats could be added as good-looking, successful craft, besides a very large fleet of smaller craft too numerous to mention here: Susquehanna, Alicia, Toinette, Reverie, Embra, Free Lance, Ballymena, etc., etc. Of the large American steam yachts Columbia and Thespiea are all that you have said of them, and neither Nourmahal, Electra or Comanche can be called very handsome, although they are not by any means failures. Peerless, Stranger and Kanapaha (Corsair I.) were good boats when built, but Atalanta was, I acknowledge, a mistake from the first. Wild Duck is a very good boat as an auxiliary cruiser, and Wadena, neither in appearance or performance, brings discredit to her builders. Dungeness has a certain peculiar appearance, but she is a boat no designer need be ashamed of. Such craft as Oneonta are generally regarded more as freaks, therefore I will not mention them in this criticism.

Sagamore you evidently think was designed by C. R. Hanscom. This is not so. She was built in 1888 of wood at the New England S. B. Co.'s yard, Bath, Me., from designs by W. S. Pattee, Bath's once famous wood ship designer. I do not intend to champion Sagamore, for she cannot be called a modern yacht. Her stern is particularly poor and the hull has a clumsy appearance throughout. Yet as regards workmanship of both hull and furnishings and performance as a cruising yacht she will stand comparison with any yacht of her type.

Now, as regards A. Cary Smith's experience as a steam yacht designer, I think you will find that Embra is indirectly his work, even if she was built and designed by Seabury & Co. Free Lance, of course, he is credited with, and I should say, after seeing the plans of Josephine, now building at Lewis Nixon's, that he is also indirectly connected with the design of that boat. His experience and remarkable success with the Peck and Lowell are also to his credit, even if they are a totally different type of vessel. C. R. Hanscom, designer of Eleanor, Peregrine and Ilawarra, was born in Portsmouth, N. H., and is therefore an American in every sense of the word; but, by the way, will Mr. Stephens kindly inform me, for information's sake (being ignorant on this point), as to the place of his birth, because it seems improbable to me that an American, no matter how conscientious, could so advocate British yachts.

You say that the Payne bill, in order to be consistent, should protect the designer also. This is very true, but as the bill, if passed, will protect the builders and all their employees, it should not be condemned for this one point. It is better to protect 99 out of 100 than not to protect a single one. If your ideas on this subject should ever come to pass and materialize, I think it would kill American steam yacht designing and building. Americans would continue to go abroad for their yachts for reasons which I have before stated, and our designers and builders would never be given an opportunity of showing their ability. Thus there would be no inducement whatever for naval architects and builders to make a speciality of this type of vessel.

W. A. F.

It would be useless to argue over what is a matter of taste, and in answer to the first part of our correspondent's letter we will only record our opinion that while the British steam yacht by no means represents perfection, the latest of them belong to a new school of designing which represents the highest point yet reached, and which is being more generally recognized each year as the standard. Eleanor, on the other hand, has the characteristic oval stern imported into this country many years ago, and almost universally used on the larger steam yachts; a stern that has been long out of date. In default of any existing authority that might decide in such a matter of taste, we are quite willing to leave the question of her entire appearance to the decision of time; if the whole course of yacht designing is not turned backward by the passage of the Payne bill, we are certain that before five years have passed our correspondent will appreciate that the yachts he names as superior in appearance to any others afloat were really behind the times now, and not up to the highest existing standards.

It is a matter of regret that the average owner of a steam yacht is apt to consider his own particular craft as the sole standard of beauty; and that among yachtsmen generally such craft as Nourmahal and Electra have long been accepted as handsome. There has been, however, a great change in this respect of late, and American yachtsmen are now fully cognizant of the deficiencies of the home-built steam yacht.

If the effort of American designers to produce something original in appearance, as mentioned by our correspondent, has yet resulted in anything but a succession of failures, we will be glad to learn of it. The examples of this school which have come under our notice start out with a big gold eagle under the bowsprit and end with a stern like a dishpan. We hope that the time may come when the American steam yacht will show a sheer and sail plan that is bold, symmetrical and harmonious, in which the curve of the stem, the figurehead, the sheer of rail, planksheer and gold stripe, the counter and the taffrail, will not only be graceful and pleasing in themselves, but will harmonize with each other. Until this time does come, designers will do better in copying the latest British yachts throughout than in merely assembling a number of odd and discordant parts.

This much must be said of the British steam yacht, that for at least twenty years past it has been in appearance bold, shipshape and sturdy, appealing to the eye as the work of one thoroughly conversant with ships. The American steam yachts, on the other hand,

look as though they were made by a tinsmith for sale in a toy store.

We certainly consider Mr. Webb's yachts as of British and not American design. If Mr. Watson, Mr. Fife or Mr. Byrne should come to this country and take out papers, we should still consider their yachts of British design.

Our correspondent has us at a disadvantage in that if we would discuss with him the various yachts mentioned by him we must make invidious comparisons of the work of different designers. This we do not desire to do; but there are some yachts whose defects are so generally known that there can be no objection to a reference to them here.

Both Namouna and Alva have always been considered very handsome yachts; what our correspondent terms a heavy and clumsy look is but a matter of taste; the British idea of a large steam yacht is derived from sea-going vessels, the American is derived from mere river launches. Of the two we prefer the British, as in Namouna, to the American, as in Atalanta and Peerless. Valiant is certainly not a handsome yacht, but she is the work of a shipbuilding firm, and not of a yacht designer; she will not compare in appearance with Alva. "Giralda" we have never seen, but the largest of the several yachts bearing that name is generally admitted to be a remarkably fine craft. The Herreshoff yachts, Ballymena, Toinette and many more, cannot be called handsome, their counters alone would place them out of the category; and they, with others mentioned, belong to a smaller class. Stranger and the first Corsair have both done good service for years; they are probably the best looking of their kind, lacking some of the striking peculiarities of the American steam yacht, but there is nothing remarkable about them in the way of beauty. Peerless, with an indifferent counter, has a specially ugly bow and figurehead, while her whole side resembles the enlarged river launch rather than a seagoing yacht. Wild Duck cannot be considered as a striking example of good design, as it was found necessary to hip her out, the work being done in a specially clumsy manner, so that she now carries two huge excrescences on her sides. Wadena suffered from the same fault, and was only made safe at a considerable cost by cutting in two and lengthening.

Embra has a stern which is something unique in its way. She has done so well in actual service that we do not care to criticize her severely, but the less said about her appearance the better; certainly our correspondent has never seen her, or he would have omitted her from the list of good-looking craft. We agree with him that the appearance of Dungeness is peculiar; most men who have seen her characterize it by stronger terms.

Mr. A. Cary Smith's work on Embra was limited solely to the underwater body, the sheer plan having been already approved by the owner before he was called upon to assist in the superintendence. He had nothing whatever to do with the new Josephine, and Free Lance is his first and thus far only steam yacht.

Only on condition that he will not reveal it, we will inform our correspondent that we were born in the city of Philadelphia, Pennsylvania, on the banks of the "American Clyde," but at the earliest opportunity we crossed the river to New Jersey and have lived there ever since. Our ancestors too, for at least two generations, were of American birth. Our only experience under a foreign government has been during ten years' residence in Hudson county, New Jersey, which is ruled by the Irish with the aid of a few Germans. We have never found it in the least inconsistent with our conception of a proper spirit of Americanism to criticize what was wrong and bad and to contend for higher standards; we take a pride in that development of the American sailing yacht and that recognition of the designer by American yachtsmen to which we and our able predecessor have contributed by criticism that, though condemned at the time as un-American, has since been justified by history as technically honest, fair and true.

Tank vs. Breaker.

THE use of fixed tanks and more or less elaborate plumbing arrangements, which is universal in this country in the smallest yachts, is the exception in Great Britain, where wooden casks or breakers, stowed below or in skids on deck, are used in all small yachts and even in some larger craft. As will be seen from the following editorial note in the *Field* of May 30, objection has been made to this arrangement in Niagara:

The question about Niagara's water tanks was of a rather serious nature, and was raised last week on a formal report to the Y. R. A. A committee under Rule 5 of the Rules for the Guidance of the Council was summoned, but nothing could be done until there was an opportunity for inspecting the yacht. This occurred on the day of the race on May 22. The tanks were found to be fitted underneath the sofa seats in the bilges and are connected by a pipe, so it was quite obvious they could be used as shifting water ballast. The captain stated the tanks were used for carrying fresh water on making passages. No proof appears to exist that they have been so used, and all the committee suggested was that the pipe connection should be severed. It was stated that the other American 20-rater, Isolde, was similarly fitted. This is an arrangement we are not used to on this side of the Atlantic, and we hope to hear that the arrangements for filling and starting the water from the tanks have been altered, as the Y. R. A. committee have asked they should be at once. It was stated incidentally that the tanks are made of copper—not a very satisfactory arrangement for carrying fresh water for crew unless means exist for cleaning them out.

The following letter from Niagara's owner appeared in the *Field* of June 6:

Editor Field:

Sir—In your issue of the 30th ultimo there appeared an article regarding the Niagara's water tanks, which, although it does not state how they might be so used, intimates that they "could be used as shifting water ballast."

As the article might mislead some of your readers into the belief that they have been used for a purpose both unseamanlike and contrary to racing rules, I desire to state emphatically that the tanks have never been used for water ballast or for any purpose whatever other than to carry water for the needs of the crew; also, that the Niagara was measured this year for a Yacht Racing Association certificate with her tanks empty, and has always raced with them in that condition. Even if the tanks were filled, the idea that they could be an advantage is absurd, as it would take 8 or 10 minutes for the water from one to run into the other through the small pipe connecting them.

I may add that nearly all racing yachts built in America use tanks in preference to carrying water in breakers, which can so readily be moved from one side of the boat to the other.

Had the committee advised me of their intended visit it would have afforded me much pleasure to have met them aboard the Niagara and aided them in their investigation.

HOWARD GOULD.

The following letter has been sent officially by the secretary of the Y. R. A.:

LONDON, May 27.—Dear Sir: A report was made to the council of the Yacht Racing Association that your yacht Niagara was fitted with a water tank under the seat on each side of the cabin, and that these were connected by a pipe, so as to make it possible by merely turning a cock to run water from one tank into the other, and thus use them as shifting water ballast, which might be advantageous in certain cases.

Three members of the council were, in consequence, requested to inspect the tanks, which they did immediately after the race of the Royal Thames Y. C., on May 22, and in your absence were afforded every facility by Capt. Barr.

The members of the council do not wish to convey any idea on their part that the tanks were used for the purpose indicated. On the contrary, their impression is the other way. But I am requested to suggest, in order to place the matter beyond suspicion, that it is desirable to make impracticable the run of water from one tank to the other, which could readily be done by a small alteration in the pipes.

I should be glad to hear, for the information of the council, that this will be done at once.

DIXON KEMP.

Unless there is something radically different in the plumbing of Niagara from that in similar yachts, we do not understand how it would be possible to use the tanks in the manner mentioned. If they are under the seat in this shallow hull they must be of very limited capacity, so small that the shifting of the contents of one necessarily for a very limited distance from the center line would have no appreciable effect on the stability of a yacht which carries her sail only by virtue of a deep and heavy lead bulb. Also, if they are arranged in the usual manner, the pipe connecting them must be so small as to require some time to discharge from one into the other. If it should appear that the yacht has two tanks of large size, and fitted with such an arrangement of pipes and valves that the contents of one may be quickly transferred to the other, there might be some grounds for the suspicions of the Y. R. A., but it does not appear that the arrangement on Niagara differs from what is so common here, of a system of metal tanks connected by suitable piping for filling and emptying. In most cases it would not be possible to use the tanks for water ballast to windward, as they are situated directly on the keelson and under the floors; but owing to the very limited room in Niagara, the only place for them is on each side under the lockers.

Steam Yachts and Marine Machinery.
COMPLETE machinery "outfits" for boat builders, made by Marine Iron Works, Chicago. Light draft work a specialty. Catalogue free.

Knickerbocker Y. C. Annual Regatta.

COLLEGE POINT—LONG ISLAND SOUND.

Saturday, June 6.

Among the smaller New York clubs the Knickerbocker Y. C. has long been recognized as one of the most progressive and enterprising. Over fifteen years ago the old club station at Port Morris was the headquarters of a notable set of young Corinthians, men who not only sailed, but cared for their own boats; who were as expert with the scraper and the paint brush as at the tiller; to whom work of any kind about a yacht was a pleasure and a thing in which they could and did take a just pride.

The club was among the first to adopt the Seawanhaka rule, in spite of much opposition. The amateur designer, builder or skipper who wandered over to the old club house of a holiday, in winter as well as summer, was always sure of plenty of congenial company, ready alike for a discussion of current yachting topics or to lend a hand in any practical work. Many of these young amateurs have long since graduated into larger craft, but the old spirit of Corinthianism still survives in the club in its new quarters at College Point. The annual regatta of Saturday, the second general regatta of the Yacht Racing Union programme, favored by a good breeze, passed off most pleasantly, both for the sailormen in the fleet and their friends aboard the club steamer. The conditions of the race were:

The starting and finishing line will be between two floats anchored off club house.

Courses: For schooners, 51ft., and 43ft. classes of sloops and yawls, around all buoys on Execution Rock Shoals and return, leaving said buoys on starboard hand, 17.5 nautical miles; for 36ft., 30ft., 25ft. classes of sloops, yawls and catboats, and special 30-footers, around Gangway Buoy and return, leaving same on starboard hand, 14.5 nautical miles; for all other classes, around Big Tom Buoy and return, leaving same on starboard hand, 10.5 nautical miles. Yachts must leave all Government buoys on proper hand excepting Gangway Buoy, which may be left on either hand by yachts sailing the longest course. All yachts must pass to the westward of Stepping Stones Lighthouse. The spindle on Success Rock may be left on either hand.

Crews: The total number of persons on board a yacht shall not exceed the allowance in the following schedule: Schooners, 13 persons; single-masted vessels and yawls (cabin), 51ft. class, 11 persons; 43ft. class, 9 persons; 36ft. class, 8 persons; 30ft. class, 6 persons; 25ft. class, 5 persons; open catboats, 30ft. class, 10 persons; 25ft. class, 8 persons.

As this race will be sailed under Corinthian restrictions, except in the schooner class, each yacht must be steered by the owner or other amateur and must be manned by amateurs, except that any cabin yacht may carry and use her regular professional crew.

The regular racing rules as to measurement, number of crew, etc., apply to the three special classes only in so far as they do not conflict with the rules under which these classes were originated.

The starters were:

SPECIAL 30FT. CLASS.		Length.
Vaquero III., H. B. Duryea.....	30.00

Apart from the 30-footers and the 15-footers, there were few new yachts. The three old-time sloops, Arrow, Kirby's famous old craft, Whaleway and Active, made an odd contrast to the modern 30-footers. Mary II. is a catboat built late in 1894 for Thomas Howell from a model by Philip Elsworth, a nice-looking boat, with a moderate overhang at each end, and very clean fore and aft lines without a hollow. She was recently bought by W. E. Elsworth and renamed Mary II., after the larger Mary so unfortunately lost at sea last winter when bound for Florida. She has had a low cabin house added this season by her new owner, with a new racing mainsail. Weasel, a new yacht last year, has been rebuilt and radically altered during the winter, her bottom being cut out and replaced, making a deep S section with extremely hollow floor, with a lead keel.

The new addition to the 15ft. class, Ulmeo, owned by W. W. Howard, was built, as before mentioned in our columns, by Fry, of Clayton, N. Y. She is a peculiar craft, long, narrow and shoal, a round-bulged boat of light displacement and low power, with a saucer-shaped section and easy fore and aft lines. She belongs to the type of Sorceress and Ethelwynn, and not to the scows and sharpies, but is unlike either of the former. Her rig is small in area and peculiar, the mast well aft, a long foot to the jib, long boom and gaff, low hoist and very low peak. The jib is rigged with a club swiveler to the mast like a spinnaker boom and handled by lines to the tack, by which it can be squared off, thus setting the sail as a spinnaker. The jib does not roll on the stay, as in the English half-raters, but the rest of the arrangement is the same. The cockpit is watertight and self-bailing, the floor curves down from the sides of the coaming to the top of trunk, making a sort of trough of semi-elliptical section. The centerboard is of aluminum and very light. She steers with a long tiller, made of two long pieces exactly like the leg of a camera tripod, on the fore end is a jointed piece about 2ft. long, used when the crew is sitting well out. With her crew in their places the boat trims so that the square transom is just immersed, while the fore end of the waterline is nearly under the mast, nearly a third of the boat being thus out of water forward.

The hull is very lightly and beautifully built.

Since the preceding Saturday Question had been scraped of her old coat of lead color and stained a dark red, the deck being repainted a sort of drab pink. In spite of the familiar rig many of the spectators failed to recognize the old boat.

There was no wind in the early morning, the atmosphere being dull and heavy, but fortunately a nice breeze came in from E.N.E., enough to make a few boats turn in a reef and some others wish that they had. The start, advertised for 11, was half an hour late, the preparatory being fired at 11:20 and the start at 11:30. The one-gun start was used throughout in all classes, the yachts getting away nicely. The first leg was close-hauled from off the station out by College Point and across the Sound, then came a beat to Throgg's Neck, and so on to the outer marks. The tide was running a strong flood at the start. In the 30ft. class Vaquero III. crossed first and Musme second, but Hera had the weather berth and improved it as they stood across, taking first place when the beating began. Paprika, sailed by O. Sherman Hoyt, was first across of the 15-footers, followed by Question, Ulmeo, Olita, Hope and Willada, the last pair being well astern of the others. Ulmeo had not gone far before her jib tack parted, but after a little delay her crew made the tack fast again and she continued. Hope also parted something aloft and lost a little time in repairing the damage. Paprika made a wise tack up close under the Point, followed by Olita and Question, while Hope and Willada held the starting tack until well across the Sound.

The 25ft. class offered a very pretty fight between Weasel and Mary II., the latter taking the lead when clear of College Point. Once on the wind, which was coming in very fresh by this time, Weasel laid down on her side after the manner of the old tonnage cutters and Mary began to get away. Mary had two reefs and with them stood up to her work, the other lying at an angle which allowed the wind to blow over her sail. Paprika gained on the fleet of little ones in the windward work and soon had a long lead. After getting well clear of the Point and out in the Sound, Question parted her peak halyards and withdrew. When Paprika neared Port Schuyler she had a long lead on the fleet, Olita, Hope and Ulmeo being near-together and

Willada well astern. When they tacked off the Fort, Ulmec came to grief, being unable to come about; she made three or four trials, missing stays each time, but finally got around.

The three large sloops had managed to keep ahead of the fleet and were lost to view, but the steamer picked up the 30-footers at the Gangway Buoy, Hera being first, with Vaquero second and Musme some distance astern of the latter. They set spinakers to starboard and carried them to Throggs Neck, the course from there in being an easy reach. Paprika continued to gain on the fleet and doubled her lead off the wind. Ulmec sailed very fast after turning the buoy, both running and reaching, and made up for her poor performance to windward, but she ignored the sailing directions, and her owner not being familiar with the Sound, passed on the wrong side of a channel buoy. She really gained nothing in distance, but was disqualified for sailing the wrong course, after finishing second to Paprika.

The wind fell after the leaders of the smaller yachts had finished, and there was a long wait for the large sloops. Arrow and Whileaway came up the Sound in company, the former ahead; both carried spinakers nearly to the line, and Whileaway managed to blanket Arrow. Though they moved slowly, the finish was interesting through the luffing and blanketing. The official times were:

SPECIAL 30-FOOTERS—START 11:35:00.

The winners were Hera, Celia, Paprika, Arrow, Eurybia, Mignon, Herbert R., Gem, Oconee, Mary II., and J. I. M. The regatta committee included Messrs. O. H. Chellborg, chairman; H. Stephenson, J. B. Palmer, J. O. Sinkinson and C. W. Schlesinger.

Atlantic Y. C. Ladies' Day.

BAY RIDGE—NEW YORK BAY.
Saturday, June 6.

The Atlantic Y. C. opened the racing season on June 6 by a ladies' day race for prizes given by the club in each class and also for the Adams prizes, offered by Vice-Com. Adams for cutters, sloops and yawls, in one division, and cats of all classes in another. The winners of the Adams prizes were barred for the club prizes. The courses were two triangles off the club house, each sailed three times, making 1 1/2 miles for the larger yachts and 1 1/4 miles for the catboats. The wind, from S.E. and of moderate strength, made as nearly as possible a reach around the course. The times were:

SLOOPS—CLASS 5.		Length
Choctaw, J. M. Strong.....	49.30	46.30
Penguin, G. L. Brighton.....	49.27	49.27
SLOOPS—CLASS 6		
Tigress, F. Weir, Jr.....	41.30	
Sultan, W. H. Cromwell.....	34.50	
SLOOPS—CLASS 7.		
Wabasso, H. B. Shaen.....		
SLOOPS—CLASS 8.		
Feydeh, E. D. Cowman.....	37.00	
SPECIAL CLASS—30 FT.		
Lynx, R. B. Lynch.....		
Wawa, J. Stillman.....		
CATBOATS—CLASS 1.		
Step Lively, F. M. Randall.....	28.30	
Squaw, H. S. Jewell.....	27.25	
CATBOATS—CLASS 2.		
Streak, C. H. Lary.....	24.50	
Presto, H. M. Crosby.....	22.40	
Ethel, F. M. Randall.....	20.66	
Tabitha, J. C. McEvitt.....	23.30	

But one of the new 30-footers, Wawa, was present, and a private match was made with the Olmstead fin-keel Lynx, the latter to receive ten minutes handicap. Lynx soon retired, her rigging giving way. The times were:

ADAMS CUPS—SLOOPS.				
	Start.	Finish.	Elapsed.	Corrected.
Choctaw.....	3 06 28	5 31 52	2 25 13	2 23 05

Ethel.....	3 16 26	5 42 29	2 26 03	2 20 43
Tabitha.....	3 16 51	Not timed.		

The winners were: Adams prizes, first leg, Choctaw and Step Lively; club prizes, Penguin, Sultan, Feydeh, Squaw and Streak. Another race for the Adams prizes will be sailed on June 13. The club house was open all the afternoon for the reception of ladies, and in the evening a very successful and agreeable musicale was given, a large number being present.

The inquiry for builders of ducking skiffs has brought two more answers, one recommending James C. Wignall, 915 Warren street, Kensington, Philadelphia, who has built this type of boat for many years in three models, one entirely open for fishing; one with decks at each end, the favorite for rail shooting, both decks being high or one high and the other low; or with a full deck, large open well and centerboard, for sailing. The other letter recommends very strongly Wm. Wisner, Jr., of Bridesburgh, Philadelphia, a builder of all classes of yachts and cats who makes a specialty of canoes and duckers.

Yacht Building and Americanism.

WHATEVER hope we may originally have entertained that our friend the *Marine Journal* would stand to its guns in the defense of its original claims for the superiority of the American steam yacht is dissipated by the following, from its issue of last week:

"The *Marine Journal* is very much gratified to have been able to furnish the very clever yachting editor of *FOREST AND STREAM* with material for several editorials in regard to the Payne bill, which was designed to prevent the free entry into this country of foreign-built yachts; but as Mr. Stephens is evidently a free ship man from the ground up, like our esteemed friend Capt. Codman, we never expect to have time in this life to get the last word with him or convince him in regard to the un-Americanness of his principles. We are very glad that his study of and discourses upon our expositions of this matter have enabled him to amazingly brighten up his columns, however, and if he could possibly throw prejudice aside he might see, as well as his fair-minded readers, the flaws in his own arguments. In his last issue, for instance, he calls it inconsistent that a yacht should be pronounced thoroughly American when it happens to be in part the product of men who were born and trained under the British flag. As well might he call it inconsistent to claim that the men who won the independence of the United States were thoroughly American, because they too were mostly born and trained under the British flag. As well might he claim that employees who leave one factory and go to an opposition concern cannot render thorough allegiance to the opposition concern and assist it in producing better creations under more advantageous circumstances than when in their old employ. It is the fundamental principles of Americanism that do not seem to be thoroughly comprehended by friend Stephens.

We resent most emphatically the charge of un-Americanism; perhaps the trouble lies in a very different conception from that of the *Marine Journal* of what is true Americanism. If it is a fundamental principle of Americanism, and we are sometimes led to fear that it is, in the estimation of some writers, to openly decry and depreciate the foreigner, his skill and the products of it, and at the same time to secretly profit by the same skill and pass it off as an American product, then we must plead guilty. If the true principle of Americanism is a hearty belief that the American can, by superior skill, enterprise and ingenuity, excel his competitors of other nations in any line of mechanical progress when once he realizes the necessity for so doing, then we claim to be American throughout; and none the less so because we fearlessly and impartially criticize what seems to us false, dishonest or technically bad. Where faults actually exist it is no Americanism, as we understand it, to deny or conceal them, and thus put a stop to all hope of remedying them.

If our arguments are so full of flaws, why does not the *Marine Journal* expose some of them instead of beating around the bush? We say again that when the question of the relative superiority of American versus foreign designers, builders and mechanics is in question, a vessel built in this country, but designed and superintended by foreign skill and put together mainly by foreigners, is to all intents and purposes as much a foreign vessel as one built on the Clyde.

The comparison of the Revolution is too childish for serious answer; our opponent descends to a shallow quibble when it compares the foreigners of 1776, who were American because their sympathies were with the struggling Colonies, to the foreigner of 1896, who is American because he can make more money in this country than at home, provided that he has the Payne bill to help him against foreign competition. To us there is nothing un-American in utilizing this foreign skill and profiting by it, but there is something decidedly un-American and also untrue and dishonest in palming off the result as something purely American and superior to the product of other countries. Certainly the *Marine Journal* must know that it is not a question of the value and advantage of this foreign skill, or of the desirability of utilizing it; but that the true issue is, what is the position of the American shipbuilder to-day beside his English, Scotch and Irish rivals? If it wishes to argue this question honestly in the domain of steam yachting, as it originally started to do, let it pick out one sea-going steam yacht designed by an American and in actual service and compare it with the average British yacht of the same class.

Meteor II.

THE new racing cutter Meteor II., designed by Watson I. for William III., and sailed by Gomes I. under the management of Lonsdale III., sailed her first race on June 4, the regatta of the Royal London Y. C. The starters were Britannia, Ailsa, Satanita, Meteor II., Hester, Isolde, Corsair and Caress. The course was from the Lower Howe around the Mouse Light and back to Gravesend, 50 miles. The wind was light and variable. Meteor soon took the lead and the following times were taken at the Mouse:

Meteor.....	3 47 27	Britannia.....	3 55 43
None of the others were near enough to be timed. Meteor continued to gain on the return, reaching along in a light breeze. In the windward work over the last of the course Britannia picked up, but still was badly beaten. The times were:			
Meteor.....	6 33 50	Ailsa.....	7 01 07
Britannia.....	6 40 07	Satanita.....	7 04 15
On June 6 Meteor won the Nore to Dover race in a moderate breeze, followed by a long calm, the times being:			
Meteor.....	4 53 49	Satanita.....	5 12 15
Britannia.....	5 07 58	Ailsa.....	

YACHTING NEWS NOTES.

The shops of the Crosby Catboat and Yacht Building Co., at Fifty-sixth street, Bay Ridge, are busy just now with three yachts: the 15-ft. freak described elsewhere, a large cabin catboat from a design by Gielow, and a knockabout designed by the firm. All three are center-board boats, the last two having lead keels. The company has a number of catboats, new and old, anchored in the basin. The adjoining yard, formerly Mumm's and then Winttingham's, is deserted, no work being done. In the old boat shop are two 20-ft. fin-keels designed by Olmstead, and a 15 footer has just been finished. A few years ago this was the principal yacht yard about New York.

The final heat for the *Outing* trophy was sailed on May 24 over the course of the Wave Crest Model Y. C., off Fifty-sixth street, Brooklyn, in a strong N. E. breeze. Dolphin carried the same rig as in the previous race, but Wave had a smaller jib and reefed mainsail. Wave soon had a good lead and held it, Dolphin giving up.

Canoeing.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the *FOREST AND STREAM*.

The Eastern Division Meet.

THE annual meet of the Eastern Division of the American Canoe Association was held on May 30-31 on Lake Quinsigamond, under the management of the Tatassit C. C., of Worcester. On Friday a number of canoeists arrived at the Lake, and were entertained by the Tatassit C. C. at a reception held on Tatassit Island, which was beautifully decorated and illuminated. The races took place on Saturday, as follows:

Unlimited Sail, three miles—Vera, F. A. Sears; Au Revoir, A. E. Davis. Au Revoir held a good position through the first round, but was disabled by the parting of a rudder chain.

Skiff Sailing Race—Penokee, F. W. Southgate; Dahind, A. H. Lang; unnamed, F. A. Sears. Dahind won.

War Canoe Race—Lawrence C. C. crew, Wawbewawa C. C. crew. The Lawrence crew won after a hard and close race.

The hand-paddling race was won by F. J. Burrage and the four paddle race by the Wawbewawa against the Lawrence crew. The tandem paddling race was won by the Wawbewawa crew from the Lake side crew. In the single paddling race M. X. Colon won. A camp fire was held on Saturday night, the camp breaking up on Sunday, which proved cold and rainy. At the annual meeting of the Division the following officers were elected: Vice-Com., Raymond Apollonio, Winchester; Rear-Com., Louis S. Drake, Auburndale; Purser, Francis J. Burrage, Boston; Executive Committee, P. C. Wiggins, Lawrence; A. W. Dowd, Hartford, Conn.; Fred. W. Taylor, Lowell. Among the many visitors at the meet were Messrs. Winne and Paul Butler. The meet was very successful, both in the number of members present and the pleasant nature of the camp. The Tatassit C. C. has purchased the point near their island for \$2,500, and will retain it in order to be sure of their neighbors and right of way.

Rifle Range and Gallery.

San Francisco Riflemen.

SAN FRANCISCO, Cal., May 25.—Nitro powder for target work has taken a strong hold on the local riflemen, the successful experiments of several members of the Columbia Rifle and Pistol Association, under the direction of F. O. Young, having led many to use it.

Among the first local riflemen to try nitro in the heavy musket was Chris Meyer, of Company C. Yesterday he achieved excellent results with 45grs. (measured) shot under two wads and a 405-gr. metal jacket bullet. The bullet was really lead nickel-plated. The wads were used to fill the space. Meyer seated his bullets firmly in the shells instead of leaving an air space, and the recoil of the musket was hardly perceptible. He used Du Pont's No. 1 rifle powder, and in one string of 25 shots he scored as follows:

5 5 4 4 5 5 5 5 5 4.....47
4 4 5 5 5 5 4 5 4.....45
5 4 4 4.....17—109

The Columbia Pistol and Rifle Club's regular shoot was held as usual, and half of the members, it was found, had become addicted to the use of the nitro. This powder they use in everything from the .22 target pistol to the high-class target rifle, with excellent results. H. R. Crane has recently gone over to the nitro ranks. He has been an expert huntsman and scored great success in the field. Now he is devoting all of his spare time to target practice. The best scores of the members yesterday were as follows:

Pistol, Blanding medal, 3 shots, open to all comers: C. M. Daiss, 8, 12, 12; J. E. Gorman, 9, 10, 11; A. H. Page, 10, 12, 14; F. O. Young, 11, 13.

Revolver, Carr medal, 5 shots: M. J. White 37, J. E. Gorman, 35, 40. Twenty-two-caliber rifle, all comers, 50yds., Rogers medal: Ed. Hovey 8, E. Jacobson 9, W. J. Burrows 34. Rifle, 200yds., Unfred diamond medal: F. O. Young, 13, 16; H. Burfeind, 15, 17, 21; A. H. Page, 16, 19, 21.

Rifle record: A. B. Dorrell 74, H. R. Crane 74, F. E. Mason 78, H. H. Burfeind 120.

Most flags for month: G. Schultz 1, F. O. Young 1, H. H. Burfeind 1. The usual bullseye shoot of the California Schuetzen Club drew out nearly all of the members. John Utschig came very close to the center and won the first prize. The scores made were as follows:

John Utschig 68 points, H. Guembel 236, H. Schroeder 240, F. P. Hagerup 311, C. Waller 350, L. Reubold 424, G. F. Robinson 434, A. Utschig 486, A. Jungbluth 501, H. Eckman 529, C. Sagehorn 529, H. Enge 566, D. W. McLaughlin 589, N. Fredericks 615, A. Breuns 646, F. Jacoby 744, R. Finking 805, A. Strecker 815, L. C. Rabbia 815, F. Attinger 833, J. Bachmann 933, J. Wollmer 966, T. F. Kelly, 1,014, F. Kuhls 1,046, T. Archer 1,065.

The winners in the California Schuetzen Cadets' bullseye contest were Messrs. Woenne, Reubold and Kullman.

The lady sharpshooters of this club were also out in full force and the contests were for the club medals. The winners were: Full champion class: Miss Lizzie Utschig 112 rings.

First class: Mrs. Kelly 111 rings. Second class: Mrs. Davison 42 rings.

There was a spirited contest for the Schuenemann diamond double-rest medal, which is to be contested for seven times. This time John Utschig was the winner with 223 points. The second best score was by Otto Baumeister with 229 and the third was by D. W. McLaughlin with 227.

ROEEL.

Revolver Shooting in England.

NORTH LONDON RIFLE CLUB.

THERE was no revolver shooting at the North London Rifle Club on May 6, but on May 13 the following scores were made at 50yds.:

J MacDonal.....	776776—40	Lieut J Howard.....	537536—29
Walter Winans.....	777636—36	Frost.....	725875—29
Lieut Clemence.....	776726—35	H Young.....	525356—26
Carter.....	556747—34	W B Thompson.....	273553—25
C Knapp.....	557745—33	Andrews.....	543462—24
A J Comber.....	537764—32	Armatage.....	272535—24
Gould.....	577544—32	W Luff.....	244464—24
R G May.....	473756—32	Ward.....	047075—23
Tilbury.....	546673—31	Polson.....	046024—16

There was a gale of wind on May 20, with rain, so no good scores were made in the revolver contests at the North London Rifle Club.

Revolver Series IV., 50yds. target:	
Walter Winans.....	664776—36
Capt Evans.....	654667—33
Lieut Clemence.....	655645—31
Carter.....	457546—31
W Luff.....	737545—31

SOUTH LONDON RIFLE CLUB.

At the South London Rifle Club on May 12 the following scores were made in the revolver competitions.

Twenty yards, stationary target:	
C F Lowe.....	776777—41
E Howe.....	676777—40
C Knapp.....	777775—40
Walter Winans.....	777657—39
Lieut J Howard.....	777657—38
Capt T W Heath.....	667675—37
Clementi-Smith.....	677757—37
A Wilson.....	655746

Cincinnati Rifle Association.

CINCINNATI, O., May 31.—The Cincinnati Rifle Association held its weekly shoot to-day. A strong 9 o'clock wind, was blowing most of the time, making good scores hard to secure. Conditions: 200yds., off-hand, standard target, 7-ring black. Scores:

Gindele.....	9 8 8 8 7 10 10 8 9 8—85
Payne.....	9 9 10 5 9 10 8 8 8 6—83
Troutstein.....	7 9 9 8 10 10 9 6 6 10—82

* Military rifle.

Rifle Club Constitutions.

We would be obliged if secretaries of rifle clubs would favor us with copies of constitutions and shooting rules, that we may send them to other clubs seeking such information.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

June 8-13.—BUFFALO, N. Y.—New York State shoot, under the auspices of the Buffalo Audubon Club; \$3,000 in merchandise prizes in State and open events; \$1,100 of cash added to purses. Experts eligible to first and second moneys only. C. S. Burkhardt, President.

June 16.—SPRINGFIELD, N. J.—Fifth tournament of the New Jersey Trap-Shooters' League, under the auspices of the Union Gun Club.

June 17-19.—CLEVELAND, O.—Third annual tournament of the Chamberlain Cartridge and Target Company. Targets thrown free; \$770 in cash also added to the purses.

June 18-20.—SPOKANE, Wash.—Twelfth annual tournament of the Sportsman's Association of the Northwest, under the auspices of the Spokane Rod and Gun Club. H. Bolster, Sec'y of Association.

June 23-26.—PITTSBURG, Pa.—Tournament of the Pittsburg Gun Club; targets; \$500 added money.

July 4.—SPRINGFIELD, N. J.—Annual tournament of the Union Gun Club; live bird and targets. E. D. Miller, Sec'y.

July 4.—PLEASANT HILL, Mo.—All-day shoot of the Pleasant Hill Gun Club.

July 4-5.—HOT SPRINGS, Ark.—Sixth annual tournament of the Arkansas State Sportsmen's Association; \$200 added money. John J. Sumpter, Jr., Sec'y.

July 22-23.—PORTLAND, Me.—Interstate Association's tournament, under the auspices of the Portland Gun Club.

July 30, 31.—GOSHEN, Ind.—Midsummer tournament of the Goshen Gun Club.

Aug. 4-6.—CHICAGO, Ill.—Tournament of the Du Pont Smokeless Powder Company. E. S. Rice, Mgr.

Aug. 11-14.—DETROIT, Mich.—Jack Parker's sixth annual international tournament. Fuller details later.

Aug. 26-27.—BURLINGTON, Vt.—Tournament of the Interstate Association, under the auspices of the Lake Side Rod and Gun Club.

Sept. 7.—MARION, N. J.—Sixth annual tournament of the Endeavor Gun Club. Targets. J. A. Creveling, Sec'y.

Sept. 8-11.—HARRISBURG, Pa.—Annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Harrisburg Shooting Association. H. B. Shoop, Sec'y.

Sept. 15-16.—KANSAS CITY, Mo.—Third annual tournament of the Schmelzer Arms Company; \$750 added money.

Oct. 7-9.—NEWBURGH, N. Y.—Annual fall tournament of the West Newburgh Gun and Rifle Association; targets and live birds; added money announced later.

October (second week).—BALTIMORE, Md.—Baltimore claims this week for her tournament. Dr. Samuel J. Fort, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The following circular, issued by the Sherbrooke Gun Club, of Sherbrooke, Quebec, shows how trap-shooting is being boomed across the border: "The Sherbrooke Gun Club will hold a tournament on its grounds in East Sherbrooke on July 1, lasting all day, to which it invites the members of the clubs of the Province. It is intended to make this shoot a popular one by having the events so arranged that all will get shooting in something near their own class, while numerous open events and added money will prove attractive to all. While we believe that easy birds will be appreciated by the greatest number, as large a variety of shooting as possible is to be given, both easy and difficult. In the division of the various sweeps both class shooting and the 'all-in-it' system will be adopted. In the latter system the amount of the entries is divided by the total number of targets broken and each shooter is paid for the birds he breaks. This is becoming a very popular system with many large clubs, having the advantage of making dropping for place impossible. This circular is sent with the desire of soliciting suggestions from the officers of clubs likely to be with us on Dominion Day. We intend to please everybody, old saws and proverbs notwithstanding. Write to our secretary if you have any pet theory as to the running of a shoot, or if you think of any event which would prove interesting, and he will be grateful for the favor. Our secretary likes his job; keep him busy. Send in your suggestions at once, please, and give us an idea of the attendance we may expect from your club."

A new organization is the Springboro, Pa., Rod and Gun Club, which came into being on June 2 of this year. The club's officers are: President, T. E. Hohenbeak; Vice-President, Emory Hall; Secretary, C. H. Miller; Treasurer, William Potter; Captain, Rev. H. H. Emmett. Our correspondent in Springboro, writing us in regard to the formation of this club, says: "We would have very fair quail, pheasant, woodcock and snipe shooting if we could only keep the pot-hunters and their curs out of the woods. The club intends to look after this matter in this locality at least, and also to attend to the shooters of black bass on their spawning beds, and the dynamiting in the deep holes." The club should join the State Sportsmen's Association and aid the Association in its efforts to obtain some much-needed legislation at Harrisburg next spring.

A series of three team races has been arranged between the Boiling Springs Gun Club, of Rutherford, N. J., and the Endeavor Gun Club, of Jersey City, N. J. The conditions are ten men to a team, 25 targets per man, unknown angles. The dates chosen are June 11, 18 and 25. The first match will be shot on the Endeavor's grounds at Marion; the second on the Boiling Springs grounds; the scene of the third match will be fixed later.

From what we can learn there will be a good Eastern delegation at the Cleveland shoot next week. The novelties offered by the management seem to have caught the boys.

We must once more remind secretaries of gun clubs and other correspondents of the great importance of mailing scores and other news notes promptly if insertion in the current issue is desired. FOREST AND STREAM's trap columns are always taxed to the utmost limit, and the rule of "first come, first served" has to be observed.

Louis Schortemeier, secretary of the New York County Gun Club, writes that the following shooters will represent that club at the New York State shoot this week: W. J. Simpson, Grant Nicholls, F. S. Edwards, J. H. Richmond, C. von Lengerke, Gus E. Greiff and L. H. Schortemeier.

The Cobweb Gun Club, of New York city, will be represented by a team in the contest for the Dean Richmond trophy at Buffalo on Saturday, June 18.

The monthly live-bird shoots of the Emerald Gun Club, of New York city, are held on the third Tuesday in each month, except in July and December, the club holding no shoot in those months.

The tournament committee of the Pittsburg (Pa.) Gun Club did good work when it compiled the programme for its tournament on June 23-25. The list of events is decidedly attractive.

Calumet Heights Gun Club.

CHICAGO, Ill., June 1.—The Decoration Day shoot of the Calumet Heights Gun Club was a great success, over 100 persons being present, including members and their families. The weather was very mixed, a strong wind from the northwest blowing hard at times. After the shooting was over the evening was spent in dancing, with musical selections, vocal and instrumental. Scores were as follows:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13

Of the above 13 events, No. 1 was at unknown angles, practice shoot; No. 2 was also at unknown angles; No. 3 was a merchandise prize event, unknown angles; No. 4, medal contest, unknown angles; No. 5, unknown angles; No. 6, walk around; No. 7, reversed order; No. 8, 5 unknown traps, gun below belt; No. 9, 10 singles, unknown angles, and 5 pairs; No. 10, practice shoot, unknown angles; No. 11, medal contest, unknown angles; No. 12, unknown angles; No. 13, consolation race, merchandise prizes, known traps and angles. (Nos. 10-13 were shot on May 31.)

A live-bird event at 10 live birds per man, handicap rise, for six merchandise prizes, was also shot on May 31, with the following result:

J H Knowles (32).....	1212212211—10	L L Davis (27).....	2011112002—7
A W Carlisle (30).....	2112222121—10	G E Marshall (30).....	1001121210—7

A C Black (27).....	0110201222—7		

The six merchandise prizes were ultimately distributed as follows: Knowles first, Westcott second, Booth third, Marshall fourth, Ferguson fifth and Harlan sixth.

Massachusetts State Shooting Association.

WORCESTER, Mass., May 27.—The eighth shoot of the Massachusetts State Shooting Association was held to-day on the grounds of the Sportsman's Club, of this city. The weather was favorable and there was a good attendance of shooters. In the race for 3-men teams the teams of the Worcester Sportsman's Club and of the Worcester Gun Club both scored a point, each breaking 25 out of 30. Scores in the team race were:

Worcester Sportsman's Club, 1st team: Davis 10, Mascroft 8, Gilman 8—26.

Worcester Gun Club team: Snell 10, Russell 8, M. Buck 8—26.

Worcester Sportsman's Club, 3d team: McLellan 8, Bucklin 9, Roach 9—26.

Worcester Sportsman's Club, 2d team: Kenerson 10, R. C. Walls 7, A. W. Walls 8—25.

Boston Shooting Association, 2d team: Eager 10, Wordsworth 7, Sawyer 8—25.

Boston Shooting Association, first team: Dickey 9, F. Bennett 9, W. W. Bennett 6—24.

Worcester Sportsman's Club, fourth team: Buck 9, Parker 6, Ide 9—24.

Hingham Gun Club: Spaulding 7, Allison 8, Howe 6—21.

In the race for the individual trophy O. R. Dickey and Snell led with clean scores of 20 each:

Dickey 20, Snell 20, Puck 15, F. Bennett 16, Geo. McLellan 17, W. L. Davis 19, Wm. Bennett 15, Sawyer 18, Mascroft 14, M. P. Roach 15, Howe 17, R. C. Walls 7, Allison 17, Eager 17, N. W. Parker 16, A. W. Walls 18, Kenerson 17, J. Tougas 15, Henderson 19, Ide 13, Russell 17, Spaulding 14, A. L. Gilman 15, M. Buck 12, E. W. Ide 13.

A list of ten sweeps was also shot during the day, the entries averaging nearly four full squads.

Another Chicago Tournament.

CHICAGO, June 8.—A meeting will be held Tuesday night of representatives of the Eureka, Garfield and Garden City clubs, of Chicago. Committees will be appointed to make preliminary arrangements looking toward a joint club target tournament at Chicago this summer or fall, targets to be thrown at 1 cent or 1½ cents. Efforts will be made to hold a big tournament. This arises out of ill feeling that Chicago is too dead as a shooting town. On Saturday next Eureka Gun Club will hold a meeting and discuss means of proper disposal of the E. C. cup in club's hands. At that meeting the question will be brought up of increasing the club membership from 50 to 100.

E. HOGUE.

The Deiter-Gilbert Match.

THE Western Union Telegraph Co.'s operator in this city, who received the special dispatch sent to this office from Chicago by Paul R. Litke, giving the result of the Deiter-Gilbert match, was responsible for a very serious error in our news columns. The dispatch, as turned out in this city, said plainly that "Geo. Deiter, of Milwaukee, was defeated," etc. What Paul Litke wrote was: "George Deiter, of Milwaukee, Wis., defeated," etc. The interchange of a for an i created all the trouble. As a matter of fact, Deiter won by one bird, scoring 84 to 83.

New York State Shoot.

BUFFALO, N. Y., June 9.—[Special to Forest and Stream.] At the convention held last night thirty-three clubs were represented. Rome and Auburn both were nominated for next year's shoot. Auburn guaranteed \$2,000 and targets at 2 cents. Rome guaranteed \$1,500. Auburn won finally by large majority. Officers elected were Charles G. Curtis, President; W. W. Dickinson, Vice-President; Clarence E. Goodrich, Secretary and Treasurer. In preliminary practice yesterday twelve 15-target events were shot. Sam Glover did best work. Jim Elliott is here and doing good shooting. Attendance of shooters very satisfactory and all prospects for big tournament are promising with the exception of weather, which is threatening. Heavy rain has taken all morning.

EDWARD BANKS.

The Interstate at Natchez.

NATCHEZ, Miss.—The Interstate Association's tournament, held here June 3-4, proved to be one of the best and most successful ever given by that association. Entries, it is true, did not run very large, 24 being high, but the entry lists kept up very well and great interest was taken in the shoot by the people of Natchez, who visited the grounds in numbers each day. The ladies of the city took special interest in the shooting and graced the grounds in rather unusual numbers for a target tournament.

The shoot was given under the auspices of the Gaillard Sporting Club. The club owns its own grounds, some twelve acres in extent, and easy of access, being only ten minutes' ride from hotel headquarters. The club has a large covered grand stand, a large shooting shed about 20x60ft., and an awning that extends over the score line, affording protection from sun and rain.

The shooting was A1 as a whole; H. L. Foote, W. H. Miller, Col. U. M. C. Thomas, Dave Porterfield and Frank Arrighi excelling in the averages. The targets (blue rocks thrown from blue rock traps) were thrown about 50yds.

The Prentiss Club made every visitor free of its rooms, presenting each one with a card admitting him to all the privileges of the club. This courtesy was gladly made use of by the visitors, who thoroughly appreciated the hospitable spirit that prompted this action. The members of the Gaillard Sporting Club, too, could not do enough to make its guests feel at home.

Among those present were: Col. U. M. C. Thomas, representing the U. M. C. Company; Dave Porterfield, representing the Du Pont and Hazard Powder companies; Irby Bennett, of the Winchester Repeating Arms Company; E. Ferriday, of Nashville, Tenn., representing the Laffin & Rand Powder Company; T. A. Divine and Abe Frank, of Memphis, Tenn.; W. H. Miller, A. Katzeimer and C. Wright, Vicksburg, Miss.; H. L. Foote and J. T. Jolly, Rolling Fork, Miss.; W. A. Huey and S. J. Enders, Shreveport, La.; J. L. Sharkey, Greenville, Miss.; Drs. Aby and Forsythe, Monroe, La.; Dr. W. T. Miles, Burnside, La.; Dr. Brangier, New Orleans; B. Y. Wade and B. Wade, Jr., Sharkey county, etc. The home club was well represented by Messrs. Baker, McDowell, Arrighi, Drs. Session and Watkins, Wilson, Gardner, Jenkins, Barkley, etc.

The trapper boys at this shoot were first class. The boy at No. 5 trap trapped 2,250 targets during the two days of the shoot and the preliminary practice work, and only broke five targets during that time. He is three silver quarters ahead as a reward for breaking the least number of targets each day. The weather, while warm, was perfect for shooting. Scores follow.

Illinois State Shoot.

CHICAGO, Ill.—The twenty-second annual convention of the Illinois State Sportsmen's Association was held at the Sherman House, Chicago, the evening of June 2. The attendance was good, twenty-seven clubs having appointed delegates. Among new faces present was that of Mr. W. F. White, general traffic manager of the Santa Fé Railroad, a member of the board of directors for the past year. President Shephard asked brevity in the business of the evening, and was brief in his opening address. He made a good presiding officer and pushed through the business of the evening in a very able fashion. In his address he referred to the deaths during the year of Dr. N. Rowe, W. J. Edbrooke and Jas. O'Brien, members of the Association. Eight new clubs were admitted to the Association—Alpine, Iroquois, Hennepin and Garden City, of Chicago; also Waukegan, Kewaunee and Canton gun clubs and the Henry Live Bird Club. The Soft Mark Gun Club has been merged into the Garden City Club, and the president ruled this to be a new club. The treasurer reported a balance of \$184.18. The board of directors offered no report, but was complimented by the president. Votes of thanks were tendered to the Eureka Gun Club for giving to the Association its 40 per cent. of the purse of the L. C. Smith cup; to Dr. Frothingham for contributing \$50 in like manner out of his purse winnings, and to Mr. Wm. Cashmore, of Birmingham, Eng., and to his representative, Dr. Carver, for the contribution of the valuable Cashmore gun.

Col. C. E. Felton introduced a resolution to the effect that the Association should urge the repeal of the license law of North Dakota and other States discriminating against non-resident sportsmen. This brought Mr. Bortree, president of the National Association, to his feet, who spoke for the license law of Dakota. He said that Texas must soon follow with a similar law or see her game go as that of Dakota has gone. It would be a step backward in sportsmanship to pass the above resolution. Col. Felton responded that it was the market shooter and not the sportsman who had cleaned out the Dakota game. Yet he seemed to resent the non-export laws of Dakota, which, he said, looked toward preventing an old or decrepit shooter from buying in the market game which he could not go out and shoot for himself. He said that so long as Dakota asked a license of Chicago shooters the latter could retaliate by declining to help Dakota in her relations to the Chicago game markets. Mr. Bortree replied by citing the Supreme Court decision on the Connecticut case, which clearly gave any State the right to pass such license law as it chose. He was sure North Dakota had passed its law simply in self-defense, as its game was being exterminated by non-residents. Mr. F. S. Baird was also opposed to Col. Felton's resolution. He thought that North Dakota had not discriminated against us any more than we had attempted to discriminate against New York and Boston in market matters. It had a right to do what it had done, and as to the non-export laws and the sale of game, he hoped to see the time when the sale of game would be prohibited altogether. Dakota had been a dumping ground for all sorts of non-resident shooters. It had passed its laws in self-defense, as it had a right to do, and it would be unseemly in the Association to interfere in such a matter. On the putting of the question, Col. Felton's resolution was lost.

Col. Felton introduced a second resolution, this one in regard to the German carp, which he stated were eating up the duck marsh in many localities and increasing in a manner alarming to sportsmen. His resolution asked conference of the officials of the Association with the wardens of other States, in regard to the best way of exterminating the carp, and, if necessary, an attempt to secure proper legislation looking toward that destruction. This resolution was passed.

Col. Felton proposed to introduce a third resolution, protesting against the perpetual muzzle ordinance which was before the city council of Chicago, under whose terms all dogs would be forced to wear a muzzle the year through. Mr. Organ stated that he had been conferring with members of the council committee having this ordinance in charge, and he felt that he could say that the ordinance would never see the light. If it did, he had Mayor Swift's assurance that it would be vetoed. The matter did not take the form of a resolution. Mr. A. C. Patterson introduced notice for a change of the shooting rules, modifying Rule 11 so that it should permit the gun to be held in any position the shooter may choose, instead of below the armpit, as the present form of the rule has it. This goes over to next year. Mr. J. H. Robbins introduced a resolution commending the Memphis Gun Club for its pronounced stand on the subject of dropping for place. Col. Felton called attention to the old-time position of the Illinois Association on this same subject, which he considered ante-dated that referred to. The resolution was lost.

Mr. R. S. Mott rose to a question of individual privilege. He represented Mr. J. A. Ruble, who had been notified by the board of directors prior to the tournament that he would not be allowed to take part in the Association contests. Mr. Mott offered a petition with many names of non-resident and resident shooters asking for the reinstatement of Mr. Ruble, who had become by the consolidation of the Soft Mark and Garden City gun clubs a regular member of the Association. Since this was so he could not be barred, unless the whole club was barred. The action of the board was therefore rescinded and Mr. Ruble will not be barred.

Warden Blow was given opportunity for brief remarks. He said he was tired of hearing of the old Blow bill, so he had made a new one which he hoped was good and which he did not want to bear his name, but that of the Citizens' bill. He spoke of the carp question, and said that many game fish were destroyed by fishers who were after carp. Lake Calumet had been devastated by such fishing, and he knew of 15 tons of bass being taken illegally there this year. He knew of 133 tons taken the past year out of one stream. It was a serious question how to destroy these carp, as a law looking to their destruction might destroy a great many game fish also. The best way would be to kill them in the winter time, when they were bedded together in large numbers.

Mr. F. S. Baird, attorney for the Association in the Kewaunee case, recounted the progress in that litigation. He hoped for a decision during this month on the motion for a new trial offered by the sportsmen to the court in the last case, due mention of which has been made in other columns of FOREST AND STREAM. Mr. Baird thought the sportsmen would win this important case.

Chicago was chosen as the place for the holding of the tournament next year. Thanks were extended to the donors of prizes and to the Sherman House. The Association approved the action of the board of directors in passing suitable resolutions upon the death of Dr. Rowe, W. J. Edbrooke and James O'Brien. The election of officers resulted as follows: President, C. E. Felton, of Chicago; First Vice-President, Dr. James Pankhurst, of Grand Detour; Second Vice-President, George Franklyn, of Evanston; Secretary and Treasurer, Frank Bissel, of Chicago.

THE TOURNAMENT.

The weather was favorable and the grounds were in good condition. The birds were of the well-known Watson quality, and for the retrieving of such few of them as were killed John Watson had increased his rolling stock to six dogs in all. The appointments at the grounds were good. Geo. Andrews did the live-bird scoring, Secretary H. B. Meyer attended to the live-bird cash, and Ike and George Watson ran the targets; Jas. Porter refereed the targets very acceptably and W. T. Irwin made a most efficient squad hustler. Messrs. Organ, Mussey and Hamlin, of the board of directors, were of general utility. The Audubon club had its customary hospitable tent, and the tent of Montgomery Ward & Co. was also there, with Mr. Stannard in charge and Mr. G. M. Holt an occasional visitor. Empire targets and traps were used, Mr. Quimby being on hand throughout the shoot. The gun trade was represented ably by Messrs. H. McMurchy, of the Hunter Arms Co.; Heikes, Elliott and Sylvester for the Winchester Company; S. A. Tucker and A. W. du Bray, of the Parker gun, this being the first Chicago tournament the latter had attended since 1893. Mr. White, of the Austin Powder Company, was on from St. Louis, and Eddie Bingham represented the Du Pont powder.

The tournament was, as it always is, for the most part a live-bird affair, only about 5,000 targets a day being thrown at the best. There were three strong live-bird events, and these practically constituted the entire tournament, though only one was open to others than Association members, the Cashmore gun event, in which the sweep was open to all non-members, though the capital prize was in competition only for members. The main Association event, for the Board of Trade badge, had 71 entries. The badge was won by Albert Bacon, of Henry, using a Parker gun, Du Pont powder and Winchester metal-lined shell. The Association State target championship event, for the L. C. Smith cup, was won by Chauncey M. Powers, of Decatur, with an L. C. Smith gun, E. C. powder and U. M. O. Trap shell. The club team championship, at live birds, was won by Evanston Gun Club, Dixon Gun Club second. In the open tournament at targets, the E. C. cup was won by Richard Merrill, of Milwaukee, who used a Greener gun, E. C. powder and U. M. O. Trap shell.

The Cashmore gun event, for the handsome Cashmore gun given by Wm. Cashmore, of Birmingham, England, through the kindly agency of Dr. W. F. Carver, called out the good entry of 86 shooters, members and non-members, and required the better part of two days for its conclusion. Of the entry, 33 shooters put in the full amount of \$20, the purse thus being a handsome one, though split into five moneys. Association members had the option of entering for the gun only for the price of the birds, they to withdraw at the second miss with money refunded for unshot birds. The gun was won by Burt Dunnill, of Fox Lake, Ill., who ran out the only 20 straight made by those in for the gun. Burt Dunnill is a brother of Harry Dunnill, who won the Board of Trade badge last year. They are both old duck shooters. Burt used an L. C. Smith gun, E. C. powder and Winchester metal-lined shell. The tidy Cashmore purse paid \$148.50 for first, which was divided on 20 straight by Richard Merrill, of Milwaukee, and Chas. M. Grim, of Clear Lake, Iowa. The former used a

Greener gun, with E. C. Powder and U. M. O. Trap shell, and Mr. Grim an L. C. Smith gun, with smokeless cases and Schultz powder.

Of the winners at the shoot Mr. Merrill was much in the lead in cash in hand, though Mr. Powers will realize more than he when he receives his percentage of the L. C. Smith cup entry next year. Mr. Grim was next in winnings. Most of this money was made at the live bird scores, for at the targets it was impossible for anyone to make any money, there being no added money and the targets being shot at 3 cents. Reference to the scores will show the quality of the shooting attendance, and what the gall needed to be to live with the field. Elliott broke 104 out of 110 one day and won \$1.50 by it. He shot a 94 gall another day and came out 15 cents loser. Rike, of Dayton, shot a 96 gall one day, and came out \$3 loser. He broke 117 out of 125 and won only \$1.50 by it. Powers, of Decatur, shot a 95 gall all one day and won only \$4.85. On one day Merrill fell down to 90 4 per cent. and came out \$2.40 loser. Again he broke 98 out of 105 and won only \$6.15. The shooters said it required a little better than a 95 per cent. gall all through to come out even on entrance and ammunition. The entry at the target trap was patchy, some 80 shooters participating in all, though much fewer shot through or nearly through.

NOTES OF THE TOURNAMENT.

Mr. George L. Deiter, winner of the Du Pont trophy in the contest with Mr. Fred Gilbert, said the return race, on Gilbert's challenge to him, would in all probability be shot at Milwaukee and at a date not far distant. In the live-bird sweeps during the week and subsequent to the match neither Deiter nor Gilbert showed what might be called championship form, though Gilbert held together much the better of the two and beat Deiter 10 birds in 40 shot at.

Gilbert has a system. If one will watch him as he loads his gun on going to the score it will be noticed he always puts in his shell so the live reading matter on the base of the shell has its center fairly in the middle of the gun barrel. If by any chance this be changed he will be sure to discover it and fix the shell around before he shoots, apparently believing it shoots straighter so. He does not know his system has been discovered, but the facts were disclosed by Mr. Tucker.

It was Mr. Tucker, by the way, who coached Capt. Du Bray at the target line until he began to break straights and make runs and trills.

Mr. McMurchy rejoiced in a pair of new red shoes of great splendor. It seems that he and Mr. Quimby matched coppers to see who should buy both pairs of shoes. The latter lost, and contented himself with settling for Mr. McMurchy's shoes and going without any for himself. He declared he was on his uppers.

Messrs. Powers and Merrill roomed together, ate together, shot together and figured averages all the time when not engaged in the above occupations. The tournament closed with these two enthusiasts begging the trappers to throw them a few birds for practice.

There was present at the shoot the type *par excellence* of the gentle amateur, Col. Bill Settle, of Cincinnati, a gentleman who made many friends. Col. Settle states that he not long ago went to a big tournament at some distance from his home. The trip cost him \$250, including his entrance money, and he took down \$1.40 in winnings. He seems well named, and for the sake of the sport it is a great pity there are not many more like him.

Wirt, of Cincinnati, was another shooter who made a pleasant impression with all and formed many acquaintances who wish him many returns to Chicago. Although new at live birds he bids fair to prove troublesome soon.

Mr. John W. Cowan, of Butte, Mont., and Mr. Dorsey Burgess, of Salt Lake City, represented the far West very pleasantly and ably. Mr. Cowan is here on business and soon returns to Montana via St. Louis and other stopping points. It will be remembered that he is prominent in sportsmen's affairs in his State, having been elected president of the State Association and done much practical work in the matter of game protection.

Mayor Tom Marshall was on hand and shot in great style. Apparently he was at his best, yet when he missed a bird he softly hummed "She may have seen better days."

Annie Oakley came out for a short time one day, but did not shoot. Dr. Carver shot targets very well, but was not so fortunate at the live birds.

Mr. Lemm, of Pekin, Ill., was dubbed the "Pearl of Pekin." Abe, George and John Kleinman were all present. A new face was that of Hollister, a prominent railroad man of this city once active at Chicago traps, but who of late has not done much shooting.

It was a great week for Milwaukee. Chicago winners were conspicuous by their absence, what Milwaukee did not take out of town went to the duck shooters of Fox Lake and the Illinois River.

The Dixon Gun Club, who won as second prize a town lot at Sturgeon Bay, Wis., state that they are advised that there is very fine bass fishing over their lot, something which must appeal to them as sportsmen.

A few more names adorn Rolla Heikes's gun stock. Messrs. Budd and Grimm remain in Chicago until Monday before departing for Davenport shoot.

Mr. Paul R. Litzke did the exacting daily work of the slings and arrows showing the flight of the live birds, and deserves entire credit for the chief labor of the carefully arranged FOREST AND STREAM report.

First event: Contest for the Board of Trade diamond badge, emblematic of the championship of the State at live birds, the winner of this year's contest to receive the proceeds of next year's entries for the same prize; 10 live birds per man, \$10 entrance:

Hurttable and Basse, who also shot in this event, scored 5 and 4 respectively, and were not, therefore, in for any of the prizes.

Of those who scored their 10 straight, Beacon won the badge on the shoot-off, Fahnestock taking the first special prize. The others divided in order named a variety of merchandise prizes.

In the 9 class Smith, Barto, Reeves, Franklin, Peterman and McFarland agreed to divide the money, shooting off for the merchandise prizes.

Of the 8s, Dunnell, Hoff, Fortier, Henry and Patterson divided the money, shooting off for the prizes.

Palmer shot out all those who had scored 7.

Alrey and Jones divided, shooting out all those who had scored 6.

Second event: Contest for the L. C. Smith Cup, emblematic of the individual State championship at inanimate targets, the winner of the cup this year to receive 60 per cent. and the club of which he is a member 40 per cent. of the entries at next year's inanimate target event, the winner to execute a bond in the sum of \$500 to guarantee the production of the cup next year. 20 targets, 3 unknown traps, entrance \$5, Illinois State rules.

The Pittsburg Programme.

THE Pittsburg, Pa., Gun Club announced early in the spring of this year that it would hold a tournament in June and add \$500 to the purses. A little later it claimed as its dates June 23-25, the Tuesday, Wednesday and Thursday of the week following the Chamberlin Cartridge Company's tournament at Cleveland, O. The trip from Cleveland to Pittsburg is only 130 miles and it was unquestionably with the idea of catching a portion of the attendance at Paul North's tournament that the Pittsburg Gun Club chose its dates, and wisely too, to our way of thinking.

There are several reasons why the Pittsburg tournament should be a success. In the first place there is the fact cited above—its dates following immediately after the Cleveland shoot. Next, the success of all previous tournaments given by this enterprising organization. Again, the amount of added money, \$500; perhaps not a large amount as such things go, but still a good round sum for any club similarly situated to voluntarily donate to the shooters for the sake of insuring a good shoot. Lastly, a capital programme and a thoroughly capable management organized to carry out that programme. FOREST AND STREAM is not given to taffy, but it never hesitates to give credit where credit is due. It is only necessary, therefore, to give the make-up of the management to prove that what we have said of that body is a fact simply and plainly stated: "Managers, Elmer E. Shaner, Jim Crow, Old Hoss; assistant managers, John Wright and W. J. McCrickart." The first three are, as the introduction quoted below says, "well and favorably known." The two last-named will be recognized better under their usual titles of "Blinks" and Bill McCrickart. Con testants in this year's Grand American Handicap will readily remember these two gentlemen. So much for the management. All the other committees are composed of men capable of carrying out their allotted duties. Visitors at the Pittsburg shoot need not be afraid of being left out in the cold.

Speaking of the introduction to the programme, the following extracts will explain many things without further words:

"The Pittsburg Gun Club was the first, in fact, the only shooting club in this section, to introduce added money at its tournaments. This year it purposes adding \$500 in cash to the purses, a sum far in excess of any amount ever added at a tournament given in this vicinity. The entire sum will be added exclusively by the club, not \$1 of it being solicited or received by subscription; it will therefore be readily understood that it is not the wish or desire of the club to enrich its treasury at the expense of the sportsmen taking part in the tournament. It is the intention, in order to facilitate the shooting, the programme as arranged being so varied and lengthy, to have three traps in position. Different styles of inanimate target shooting will be introduced, that the expert as well as the most capacious amateur will hold that his interest has been subserved. The immediate management of the tournament will be in the hands of Elmer E. Shaner, Jim Crow and Old Hoss, all of whom are well and favorably known wherever the sport of trap-shooting is indulged in. The success of previous tournaments under the same management is a sufficient guarantee of what may be expected at the present. If at the close of the tournament the sportsmen taking part in same are satisfied that they have been fairly treated and had an enjoyable time, then the club's object in the giving of this shoot will have been attained."

As stated above, three sets of traps will be in position; these will be bluerock traps, bluerock targets being used. On two sets of traps the following programme will be shot out each day: Five 15-target events, \$2, \$10 added to each purse, four moneys; five 20-target events, \$2.50, \$20 added to each purse, five moneys. All these events will be at unknown angles.

On the third set of traps the programme is a different one. For the first day, June 23, this set will be taken up with the decision of the Pittsburg Gun Club's annual handicap target race, 100 to 115 targets, 16yds. rise, unknown angles, \$5, targets extra, \$50 added to the purse, 5 moneys. In addition to first money the American E. C. Powder Company will present a silver cup to the winner. The system of handicapping is explained thus: "The expert shots will shoot at 100 targets, while the less skillful shots will be allowed to shoot at from 1 to 15 targets more than 100. No shooter will be scored more than 100 breaks. All handicaps will be secret, no shooter knowing how many extra targets he will be allowed to shoot at until the bell rings for him to drop out, his score having been finished. By this system of handicapping interest will be maintained until the last shot is fired."

On the second and third days of the shoot, June 24-25, the third set of traps will be kept busy with a programme of four 15-target events, \$1.50, 4 moneys, expert rule, one man up. This style of shooting, once so popular, is fast coming into popularity again, so that we may take it for granted that the No. 3 set of traps will not lack for patronage.

All shells forwarded in care of Elmer E. Shaner, 123 Diamond Market, Pittsburg, Pa., will be delivered at the grounds free of charge. The shoot will take place at Exposition Park, six minutes' ride from the center of Pittsburg or Allegheny City. Headquarters for shooters are Hotel Anderson, Penn avenue and Sixth street, and Hotel Willey, 15 Sixth street. Any further information can be readily obtained by addressing the secretary of the club, Elmer E. Shaner, at address given above.

South Side Gun Club, of Milwaukee.

CHICAGO, Ill., May 31.—The twelfth annual tournament of the above-named club was held at the club grounds, Lake Station, May 28 to 30. The attendance was not very large, as no special inducements were offered, there being no added money announced. The entries ran higher on the third day than on any of the previous days. There were some shooters present from the neighboring cities, among the number being J. A. R. Elliott, of Kansas City. Jim shot a 97 per cent. gait on the second day, and made one run of 105, and that evening when he had counted his receipts he found that he was just \$4.25 ahead of the game. He might have duplicated the feat on the last day, but unfortunately he was taken very sick that night, but nevertheless he shot in all the events on the following day, but of course could not shoot up to his usual form. Then there was John Ruble, of Chicago. When I saw John he was bewailing his misfortune. On the second day he broke 30 straight and paid an entrance fee of \$3, and only received in return \$1.85.

The programme consisted of all kinds of events, ranging from 10 to 30-target events, and most of the events were known traps and angles. The targets were thrown from 35 to 40yds. One of the principal events on the last day was the Plankinton Hotel purse, \$25. This event had twenty-two entries, and each paid \$2.50 for the privilege of shooting for the \$25; no more, no less. Targets were thrown at 3 cents each.

Below are the scores:

Montana State Sportsmen's Association.

MISSOULA, Mont., May 25.—There has been a tournament at Missoula. At least, that is what some of the boys are saying, and the boys should certainly be authority in the matter, as they are all more or less practically aware of having been to a shooting match.

The third annual tournament of the Montana State Sportsmen's Association, held in this city on May 22-24, is conceded by all who attended it as having been by long odds the most successful shooting tournament ever brought off in the State.

It is a pretty generally accepted fact that of all the cranks the crankiest crank is a gun crank, and when a lot of the *genus gunibius crankibus* (I guess that's what you'd call him) are gathered together in one flock it is the rule that being in his own peculiar sphere the gun crank is properly located to indulge his natural propensities; and he forgets not to do so, while cranky consequences follow after. However, every rule has its exception, the exception to the above rule being the Missoula meet. It must have been that every crank left his cranky clothes at home, and wore only his shooting outfit. The entire affair ran along as smoothly as if the machinery of the event had been carefully oiled throughout, and—perhaps it was.

Nature herself, who for weeks had had only storms and frowns to bestow on the "ants of the earth" in these parts, deigned to put on a less forbidding countenance during the greater portion of the time, to the great delight of the shooters and their friends. It may have been the weather. It may have been the people. Probably it was the grounds or the accommodations. Possibly it was the —. No, we will not venture to flatter ourselves that the management of the thing should be considered; but anyway, there was scarcely a jar, a wrangle or any sort of friction whatever to mar the pleasure of the event, and we trust that no shooter had cause to think that he had not been accorded treatment just and fair. The attendance, while good, was not what might be termed large. Forty-five was the greatest number of entries in any one event, but the average ran close to forty throughout the bluerock events, barring championship shoots.

There were not so many who took part in the live-bird shooting, but there were as many as the club could have satisfied, as all pigeons that could be procured were trapped. The day preceding the commencement of the tournament about a score of shooters were on hand at quite an early hour, and the day was spent by them in practice and sweepstake shooting, with but little less interest displayed than was shown in the three succeeding days.

THE ANNUAL CONVENTION.

On the evening of the first day a meeting of the Association was held, at which time M. B. Brownlee, of Anaconda, was chosen President for the ensuing year; J. M. Evans, of Missoula, Vice-President, and C. H. Smith, of Butte, was re-elected Secretary and Treasurer, as were also P. E. McGowan, of Phillipsburg; J. P. Menard, of Missoula, and T. H. Pleasant, of Helena, to act with the president and secretary as a board of directors. W. H. Wright, the well-known hunter and guide, was elected an honorary member of the Association.

It was decided to use the influence of the Association toward securing at the next session of the State Legislature the passage of a more wholesome set of game laws than those with which the statute books of the State are now burdened, and also to use its influence to secure a better enforcement of such laws as may be adopted.

The city of Anaconda was decided upon as the place in which to hold the next annual tournament.

At an adjourned meeting, held the week following, it was decided that the Association should provide a new live-bird trophy to be known as the Challenge Trophy, and that the second high gun of the live-bird championship shoot of the following day should receive it, he to be subject to challenge by any member of the Association at any time during the year on thirty days' notice.

THE SHOOT.

The ball opened with a 10-bird, unknown angles, sweep, not included in the general averages, and the following scores were made: W. Hillis 7, C. H. Smith 9, M. Brownlee 8, Rockefeller 8, Menard 8, Bartlett 10, W. Neu 8, J. Neu 6, Brownlee 7, Wright 9, Jones 9, Eastman 6, Fisk 10, Selvidge 9, Conley 9, Denison 8, McGowan 8, Twohy 8, C. A. Tuttle 7, Thompson 8, Norris 8, J. Evans 10, Cave 8, Brayton 6, Searles 7, Hymer 6, C. H. Buck 7, Williams 10, Holohan 8, H. C. Tuttle 8, Rogers 7, Kennett 7, Barbour 8, Clark 7, Heard 6, O. F. Smith 8, T. Evans 5, Coyle 7, Ware 7, Sisson 10, Van Wyck 8, Considine 9.

The items on which interest was centered principally were the championship events and the general averages. A shooter in order to secure a chance at a general average prize must have shot through all of events numbered 2, 3, 5, 6, 7, 8, 9, 10, 12, 13 and 14. There were but twenty-three who shot through, and below is given table of all entries in any of these events, and showing the averages of those who shot through.

GENERAL AVERAGES.

It will be seen from the above table that C. H. Smith, of Butte, secretary and treasurer of the Association, made the highest average.

The team championship cup shoot (fourth event, first day) was won by the Missoula team No. 1 on a score of 63 out of a possible 75, known angles. Scores in this event were:

Missoula No. 1: Menard 23, J. Evans 23, Williams 23—63.
Butte: Jones 23, C. H. Smith 23, Wright 23—66.
Anaconda No. 2: Denison 23, Rockefeller 23, C. A. Tuttle 19—65.
Anaconda No. 1: Twohy 23, Bartlett 20, Conley 20—63.
Helena: Fisk 24, Kennett 19, Barbour 18—61.
Missoula No. 2: Clark

Forest and Stream Water Colors

We have prepared as premiums a series of four artistic and beautiful reproductions of original water colors, painted expressly for the FOREST AND STREAM. The subjects are outdoor scenes:

Jacksnipe Coming In. "He's Got Them" (Quail Shooting). Vigilant and Valkyrie. Bass Fishing at Block Island.

The plates are for frames 14 x 19 in. They are done in twelve colors, and are rich in effect. They are furnished to old or new subscribers on the following terms:

Forest and Stream one year and the set of four pictures, \$5.
Forest and Stream 6 months and any two of the pictures, \$3.
Price of the pictures alone, \$1.50 each; \$5 for the set.

Remit by express money order or postal money order. Make orders payable to

FOREST AND STREAM PUB. CO., New York.

LAKE CRESCENT TROUT.

THOSE of our angling readers who have followed Admiral Beardslee's relation of his experience with the large trout of Lake Crescent, will congratulate him upon the superb fishing he has found and upon the realization of many a fisherman's dream of introducing to the world of anglers a new fish. Everyone in the vicinity of Lake Crescent appears to have caught the fever this spring, and there has come to us a story of an experience had by one of the fair anglers of Lake Crescent which proves more conclusively than does anything which Piseco has written that the Beardslee trout is truly to be ranked as a game fish. This is the incident as related by Mr. Carrigan: "The same day that Mrs. Michell caught the 14-pound rainbow she hooked and had a very hard fight with a monster Beardslee. She managed to get it up to the boat four times, but it fought with such desperation and was so heavy and powerful that she could not land it, and finally it tore away from the hook and she lost it. Her idea is that it was at least 36 to 40 in. long, a foot in depth and weighed certainly a third more than the 14-pounder, it was by far the largest trout she had ever seen, and she has caught many big ones."

In short, the big one got away. That gives the stamp of nobility to the new Lake Crescent trout, and demonstrates its fitness to figure effectively in fish stories.

PHEASANT EGGS AND DUCK EGGS.

A CONSIGNMENT of pheasant and partridge eggs was brought from Europe to this port last week, and was held up at the Custom House under the clause of the tariff law which forbids the importation of game birds' eggs. The eggs were consigned to Theodore Havemeyer, and were intended for stocking a game preserve and adding to the shooting resources of New Jersey. It apparently had not occurred to any of those who were concerned in the enterprise that it was forbidden by the United States statutes thus to increase the game supply. Section 471 of the act of Aug. 28, 1894, specifies as under the free list: "Eggs of birds, fish and insects; provided, however, that this shall not be held to include the eggs of game birds, the importation of which is prohibited except specimens for scientific collections."

The seizure of the pheasant eggs last week led to various surmises respecting the purpose of those who were instrumental in making such a law. One of the papers quotes Mr. John S. Wise, who relates that last year he had a similar experience when he attempted to import some pheasant eggs for a game club in Virginia, and they were seized upon receipt at the Custom House. The price charged Mr. Wise for the eggs in England was \$15 per dozen, while a dealer in this country asked \$75 a dozen, and it was assumed that the prohibitory law had been instigated by speculative traders in this country. On the other hand, a pheasant breeder tells us that the law was adopted at the request of farmers in the South and West, who were opposed to sportsmen trespassing on their lands and took this means to discourage the threatened increase of game by foreign hordes.

Both of these theories are fanciful; neither is the true one. The statute was an outgrowth of the northern Indian duck egg destruction foolishness. In the early stages of that delusion, before the far-away egg smashing

had been definitely located in Alaska, the talk was more vague, and the Indians of the British Provinces were held accountable for the wildfowl albumen industry. The purpose of the well-meaning individuals who secured the adoption of this statute was to insure good shooting to American sportsmen by cutting off the trade in duck eggs imported from Canada for trade purposes. Subsequently the victims of the duck egg mania transferred the scene of destruction from British North America to Alaska; but the law had been enacted, and it yet remains, although the duck egg albumen myth has been exploded. Thus it has come about that a statute adopted ostensibly in the interest of game protection is proving an unwarranted obstacle to game interests. It should be repealed.

THE RANGE IN JUNE.

BACK and forward over the broad expanse of the cattle country there passes constantly the lonely figure of the range rider. His tough, wiry pony, his broad hat, shaps, rope and six shooter mark him for a cow puncher as soon as you get near him; and when you meet and stop to chat, as of course you will, he will ask you if you have seen the horses he is looking for, and will exhibit a politely veiled surprise if you cannot rattle off to him the brands of all the animals you have seen in a week's ride. He is friendly and expansive, and very glad to meet any one with whom he can exchange a little conversation, since often for days at a time he has only his horse to talk to. He is interested in all that is going on, and will give you the talk of the range, telling you where the round-up camps are to be, and what has happened at the ranches he has last visited. In return he expects the latest news from town and the stray gossip that may have drifted to you from the distant East.

When at last the range rider leaves you with a pleasant "Well, so long, pardner," you realize that you have parted with a type whose further acquaintance you would have enjoyed, and while you watch him as he glides away over the rolling swells of the prairie you feel that you can understand something of the attractions of this free outdoor life.

The range rider is tough, hardy and enduring. He makes no complaint about anything that happens to him, and with calm philosophy faces alike the rains of spring, the heats of summer and the winter's storms. Many of his kind have perished while bravely doing their duty on the range, yielding to the biting blizzards of midwinter or being swept away while trying to cross boiling streams, bank full of the spring snow water, their bodies to be recovered months later when stumbled on by some one of their fellows.

Although he may not find his stock, the rider who is in search of lost horses sees many a sight that is worth looking at. Even the commonest landscape that meets his clear, quick eye is worth contemplation and study. The range rider is an observer; he knows how to use his eyes; he sees what is going on about him. No one quicker than he to detect the dark back of a feeding animal appearing over a distant crest, or to catch a shod horse track in the dry, hard dirt, or to make out the brand on a timid heifer as she whirls to run. All this keenness is for the signs of his own trade, yet he is not blind to many of the facts of nature that are constantly going on about him. He knows all the larger animals and their habits; he is familiar with many of the birds, and has more knowledge of plants than just enough to tell *loco* from poison weed and quaking aspen from sage brush. Yet after all he knows nothing so well as he knows his cows and horses, which occupy all his time and nearly all his thoughts.

As the range rider passes over some higher crest of the prairie swell that overlooks a wide landscape, he may pause on the ridge to light his pipe and perhaps to examine with his glasses distant objects which dot the prairie, to see if perhaps among them he may find the animals he seeks. Here he dismounts, and throwing the bridle rein down over the horse's head seats himself on the ground amid the sage brush to look the country over. It is pleasant to sit here in the warm sun and to gaze upon the broad prospect stretching in all directions for miles and miles. The grass is green and the nearby prairie in June is decked with flowers, which in a few weeks, when the plants have matured under the scorching sun, will all be gone. Now there are tiny yellow violets and pale harebells and flaunting larkspurs, with here and there a patch of the brilliant blooms of the cactus. Down in the damp places the ground is blue with *fleur de lis*, and the shining white prairie poppies carpet spots on the drier hillsides.

The far-off horizon which limits the view here is bounded by sloping swells, there by loftier hills capped by jagged pinnacles of rock or by dark-green timber. Distance softens the harsher features of the landscape, so that rough and gullied bluff and precipitous rock-strewn mountainside alike seem smooth and gently rising. The far-stretching prairie is silvery with sagebrush, or patched here and there with green, where the waters from some spring or rivulet spreading out moisten the ground and nourish fresh and tender grass. Perhaps near some of these meadows lie gleaming lakes, whose shining surfaces tell falsely of cool, pure water, and in the olden time might have lured the thirst-tortured traveler to bitter disappointment at their muddy alkaline margins. Here and there from the higher slopes descending lines of vivid green trace the courses of rills whose springs are in the rocks above, and which hurry toward the lower ground, there to disappear—sucked up by the thirsty soil; and at intervals along their borders are groves of white-stemmed quaking aspens whose pale color ever changes with the constant motion of their leaves.

Within this basin, down on the prairie below and on the hillsides, is the life of the land, a part of it visible even at this distance, but the most of it unseen. Feeding cattle and horses are scattered out far and near, the nearest easily recognized, the more distant mere black dots. Antelope are seen feeding among the nearby stock, but other animals less in size, though nearer, are invisible. Yet the watcher knows that on the hillsides are sleeping wolves and coyotes; that jack rabbits crouch beneath the sage bushes and great grouse stalk among their gnarled stems; that wild ducks are swimming on the surface of each little lake, while near their borders shrill-voiced killdees run and stop and run again; that on the flats the prairie dogs are lazily waddling about, or sitting upright at the mouths of their holes; that the badger, slow of motion, but stout of frame, is wandering over the prairie seeking what he may devour; and that wide-winged marsh hawks, with deliberate flight, are hunting backward and forward, each over his own range, scaring the little birds and capturing now and then a mouse.

All these things the watcher knows, but now scarcely remembers, yet as he takes out and slowly polishes his glasses and gazes over the country before him he unconsciously makes note of the whole scene. And while he sits here the breeze hums through hair and beard, and blows out his horse's tail and the stirrups and the thrown down bridle; and as he inhales the fragrance of the blossoming sage brush, and hears the voice of passing bird, and is warmed by the sun, he feels that it is good to be here and to see and know these things.

Such is the range in early summer, but there is another side to this life—the range in winter.

AGITATE.

THE paper on game protection read by Commissioner H. P. Frothingham before the American Fisheries Society should have careful reading, for it comes from one who has been engaged in the practical study of the problems involved. The task of preserving the fish and game supply is not inherently one of extreme difficulty, on the contrary it is simplicity itself. Prescribe the close seasons indicated by nature as the periods for breeding and maturing. Forbid the methods demonstrated by practice and experience to be wasteful and destructive beyond power to recuperate. Limit the taking to such measure as that all those who participate in the taking of fish and game shall have the privilege of securing their equitable shares and no more. And that is all. It is simplicity itself. Why then is the protection of fish and game at loose ends, ship-shod and shamefully ineffective? Not because of any inherent complexity or hindrance, but purely by reason of the indifference, indolence, inaction and neglect of the community at large and of interested citizens in particular. Taken as a whole, the public cares not a rap for fish and game preservation, except, as Mr. Frothingham points out, for a sentimental acquiescence in the theory that the species of useful animal should be perpetuated. But for specific protection nine in ten care nothing. The village apostle of game conservation flocks by himself. The subject is one with which the public is not concerned.

Here lies the whole difficulty. Game is not protected simply because there is not sufficient interest to secure its protection. The real problem then is how public opinion shall be created, controlled and directed. Once this is done what remains is simple in the extreme.

The Sportsman Tourist.

A GANDER PULL IN ARKANSAW.

BY FRED MATHER.

"HADN'T yo' better stop an' see the gander pull this evenin'?" asked the landlord, after my bill for supper, lodging and breakfast had been paid, and inquiries made as to the road that struck the nearest stream which, if followed, led to a branch of the Bodeau River.

"A gander pull?"

"Yes, we're gwine to have a gander pull, an' if yo' never see none yo' better stop and see the fun, fo' they'll be a heap of it, an' as yo' seem fond o' spo't I reckon yo'll inj'y it," and he stretched his huge form in the doorway as he remarked on the prospect of a fine day for the "pull."

It was my plan to follow some small stream to Lewisville, where the alcohol tanks for such fishes as could be collected in southwestern Arkansas were stored, and then to follow the little river down into Louisiana to Bodeau Lake; but the landlord's suggestion was tempting, and a day could be profitably devoted to the study of birds, for surely I had heard old darky Sam say that the birds were as fine as he "ever see," and the "gander pulling" related to some sport with geese. A question to the landlord would betray ignorance, Sam was the one to get information from.

"So the birds are fine ones, are they, Sam?"

"Deed dey is, sah, as good as I ever hung, sah!"

They were to be hung; that fact was recorded, and a look at the "birds" proved them to be "sure enough" ganders, common every-day ganders, such as lead the flock on all occasions; and now that they hung them the questions how, where, and what the nature of the sport might be after they were hung, outweighed the number and kind of fishes that were in all the rivers of the State. Old Sam sat on an upturned pail washing a piece of harness in another pail, humming an old melody as he soaped the sponge, and was absorbed in contemplation of the coming sport. It was evident that he must be humored in order to get at a knowledge of the rules governing the sport of gander pulling without exciting a suspicion that I was ignorant of a thing which seemed to be so common that mere mention of it was enough to satisfy ordinary minds, and a random shot was fired to draw him out.

"I reckon you've hung a great many ganders in your time, Sam."

"Deed I has, sah! I'se reckoned de bes' han' aroun' dese parts, suah, an' dey sen' fo' me all obah, sar! Dey say I makes 'em slicker dan any ob 'em."

Beyond the fact that it was desirable that the ganders should be made "slick" the question was a failure. Besides the tavern the place had a dwelling and a blacksmith shop, and a sign over the latter told that Jo Bevins was a first-class horseshoer, and the ring of his anvil announced that he was within. Perhaps he could help to unravel the problem, and on the impulse I left old Sam singing:

"De hen an' chickens dey gwine for to roos',
De hawk flew down an' he bit de ole goose,
He hit de ole hen in de middle ob de back,
An' I r'ally b'l'ev dat am a fac'.
Den git along, John," etc.

Mr. Bevins was a short man with a development of chest and arms much too great for his legs and he seemed top-heavy. His keen eyes and ready response to my salutation showed a natural curiosity in a stranger who was evidently not a native, and in reply to my remark that there was to be a gander pull in the evening, for I had learned to drop the Northern term "afternoon," he said: "Yes, and there'll be a good turnout of the boys from Prescott, Bourland's Store and Falcon, and lots o' fun. I reckon you're a stranger in these parts." This latter remark was partly in the form of a question and he was told that a little pleasure trip and a desire to attend the "pull" brought me there and I switched him off with:

"They say that Old Sam is a smart hand at hanging ganders."

"Yes, he is, an' he ought to be; he's done enough of it fo' the last fawty year."

"He seems to make 'em slick, from what I hear."

"Deed he does; he's got some secret o' making grease that's slipperier'n most grease, and he picks the feathes' off the neck so careful that not a pin feathah is left, an' last year Bill Turley, one of the best gander pullahs in this county, took his turn with eight othe's and pulled foah times, an' his hoss slowed down each time afore he could twist that ganda's head off, an' it wa'n't an old ganda' at that!"

Here I had it, without any display of ignorance. Bill Turley was a champion gander puller and had pulled four times in his turn, the eight others had pulled three times each, or twenty-eight pulls on the picked and greased neck of a live gander before his obdurate head was induced to leave his body. Surely, this was an intellectual treat of a new kind, before which bull fighting, with its disemboweled horses, was a degrading spectacle. Here was something which a horse might enjoy with his master, and who could say that the gander might not also enjoy the tournament and imagine himself the highly honored object for which renowned knights were contending, and by skillfully dodging some and resigning his head to more favored ones he could choose the knight upon whose banner victory should perch. Such a royal game was never thought of by Richard Cœur de Lion, Ivanhoe, or the Black Knight! We would witness this grand game, which was fit for princes, if they had ever been blessed with wit enough to discover it.

Returning to the old darky, I proceeded to impress upon him the fact that a gander pull had been an every-day thing in my experience by saying: "Sam, Jo Bevins says that you don't make the geese as slick as you used to, he thinks you put in too much butter and not enough tar and the butter melts and runs off. Now, up in Izard county, in the north part of this State, where I saw the last gander pull, the man who handled the birds said that he did not use any butter, and —"

"What Jo Bevins been tellin' you? What he know bout how I make my slush? No man know dat. Butter! ha, ha! He better look fo' dat avn his bread, ha, ha! He been tellin' you 'bout me fo' a drink, an' dat 'minds me I didn't get one dis mawnin', been so busy dat I forgot bout it."

His game worked if mine failed, and after wiping his

lips and hanging up the harness he pulled out a peculiar strap about an inch wide with a slit in one end and a hole in the other, and carefully oiled it; I ventured to ask: "What part of a harness is that, Sam?" He looked up with a grin and said:

"I reckon you neber seed many gander pulls, sho'. Dat's de h'istin' strap w'at dey's h'isted by so's it doan hurt dere laigs like a string do. I spected dat dey doan hab gander pulls in de Norf—you is fum de Norf, so Misser Wilson said, an' my boy Jake he went off up dat a-way two yeah ago, Boss'on dey calls de place. I spec' you neber seen him?"

Assuring Sam that I had somehow missed seeing his boy, and feeling defeated at my game, I strolled off up the road and into the fields to pass the time until dinner. It was a perfect autumn day, the maples on the higher ground just showing the different yellows, while those near a swamp were glowing red; in the shaded spots the grass was hung with spider webs which still held the dew and made them gorgeous with a wealth of diamonds. The quail were calling from the stubble; gaudy jays screamed from the thickets and flocks of blackbirds chattered in the alders. A large fox squirrel ran up a persimmon tree that was red with fruit not yet palatable to man, and if it was to him he gave no evidence of it. A hawk moving in graceful circles next claimed attention, and while I was pondering on his mysterious power of soaring he descended and skirted the wood—poised, plunged and bore off a half-grown rabbit whose pitiful cries turned my thought into another channel. Nature had shown her beautiful, holiday side, and at once turned to show how pitiless and unrelenting are her laws! Hawks are hungry, rabbits are good food; and so the train of thought led to man and the fact that ganders are good food, and so to dinner.

While chatting with the blacksmith after dinner a tall, powerful man of about 40 years, with a well-trimmed beard, in which streaks of gray began to show, rode up on a clean-limbed iron gray horse, dismounted and kitched him to the pole.

"That," said Bevins, "is Old Bill Turley and he's one of them quiet kind that 'tends his own business, but it won't do for any of the smart fellahs to go projectin' 'round him, an' they know it."

Turley nodded as he passed in to the bar room, and a glance in his clear blue eye confirmed the blacksmith's words, and I certainly should not "go projectin' 'round him." New arrivals were confidentially announced to me as follows:

"That old feller is Sile Johnson; he fit in the war, and never gits drunk only at a rifle shoot or a gander pull; says he likes to see young men fight, but his fightin' day is done past. Yere's George Washington Simpkins, him on the gray; he's in for everything like fun, but allers gets too full to inj'y it; them fellahs just hitchin' now is Ben Kellum with the bay mare and Pete Murphy with the black hoss; they are young sprouts just comin' up and both keepin' company with the same gal over near Bourland's. Excuse me, I want to see Turley."

From the seat outside could be heard the clink of glasses, greetings, laughter at some joke, mainly personal, more glasses and reminiscences until the question of time began to obtrude. Old Sam sat on the edge of the step and to a question he replied: "Dar's no hussle, sah! Dey has got to hab time fo' a few drinks befo' de contes' so dey can git limb'd up propah, and den Misser Wilson he doan make nuffin' on de birds. Lordy! sometime de fust man get de gander fo' a nickel, an' as dey's all in I'se got to put up anudder one. Doan make a nickel on dat work an' doan 'spect to; it's de bar pays, but I got de work to do and dey doan gi' me no drink till I'se done."

A low-set brindle dog lay on the step near old Sam, taking no further interest in worldly affairs than to snap at the flies which chose his ears as a tryst or to dislodge a flea from its chosen spot, when down the road came a big yellow dog tracking some boys who had arrived a while before. Brindle dropped his ears and raised the hair on his back, as the stranger turned to the house, and rose with great dignity. The stranger stopped, moved obliquely forward as if to get in the rear of the slowly advancing brindle; a pause, a spring, and the battle was on. At the first sound of the conflict there was a rush from the bar-room. "Form a ring!" "Give 'em fair play!" "Go in, yaller!" "Shake him, Turk!" All this in one breath. The yellow dog was heavier than Turk and had him by the throat and under him. "Five dollars on yaller!" shouted Ben Kellum, "I never seed him afore, but he's a winner!" and before he could flourish his money Turley quietly said: "Young man, I don't want yo' money, but he can't lick that brindle for the drinks; will you go it?" "Sure, all right, yaller wins for the drinks." All this time the hold of the yellow dog was unbroken and the brindle was using his legs trying to get a tooth hold on an ear or elsewhere, when with a twist he got hold of a forefoot and toyed with it until "yaller" let go his hold and lifed up his voice in a manner that signified that fighting was not just what he wanted, and after brindle was forced to let go there was a yellow streak down the road and Bill Turley tapped Ben on the shoulder saying, "Young man, the drinks are on you," and all hands went inside. Old Sam remarked to me: "Dat fool boy bet on dat yalla' dog, he he! I know that ole Turk, seen him fight afo'. He's Bill Turley's dog; two yalla's neber lick him, neber."

The time had come when in the opinion of the landlord everybody was in prime condition for sport and he gave Sam a look that he understood, for he went to a shed and soon trundled a barrow down the road to a big oak tree which stretched a great arm across the road and spread its branches beyond the opposite fence. The barrow carried a box which contained ten strong ganders with their necks neatly divested of every feather. Throwing a light line over the limb, he tied in his leather noose, gave a gander's neck a thick coating of grease and swung him up by both feet at the proper height. Meanwhile the landlord's son had set his business table at the starting point, just 100yds. away, and under the shade of a maple. The men were mounted and each had paid his entry and drawn straws for turn. The gander had ceased flopping and was hanging head down awaiting the fun.

Sile Johnson, the ex-Confed., came first on a bay plow horse with four white feet. With a yell that scared a buzzard from a feast half a mile away he plied the whip and started. His coat was off and his right arm bare to the elbow, his hat left him the first few rods and his hair streamed out behind. Nearing his quarry, he shifted the whip to his bridle hand, raised his right and grabbed.

The gander dodged and the crowd yelled. Simpkins followed on a big gray and greased his hand on the bird. Kellum on a bay mare and Pete Murphy on a black horse made clean misses. Then came Bill Turley on a strong iron-gray. "Bill," said a small boy, "he's a-waitin' fer you, an' ef you don't git him he'll git tired." As he started he pulled his pocket handkerchief, and cries of "Foul!" went up; but he merely wiped his eye and returned it just in time to grip the gander close to the head, and left the bird neatly decapitated in the air. Cheers went up, and as he joined the crowd he remarked, "Let's take something on the first goose," and the motion was carried unanimously. So far I had held aloof and escaped special notice, and continued to do so until five tournaments had been run, the second gander to Murphy, third to Turley, fourth to Kellum and fifth to Sile Johnson. By this time the drinks had begun to tell on Sile, and Jo Bevins said to me in confidence that the old man was "beginnin' to feel to'able numerous." But Sile proposed to celebrate his skill and invited all hands to the bar. He noticed me for the first time. My light overcoat had been laid off and his eye struck a Grand Army button. "Hello, Yank!" yelled he, to which I replied with the old picket-line greeting, "Hello, Johnny!"

"Put it thah," said he, extending his hand. "What corps was yo' with?"

"Second Corps, Army of the Potomac, First Division, campaign of '64."

"Why, yo' pizen old Yank! That was Hancock's corps. I knowed 'em fust rate, ought to, met 'em offen 'nuff. Say! I was with old Jube Early; ever heah o' him? Bet yo' did, fo' we kep' yo' all busy sometimes, druv yo' outen the Wilde'ness an' doubled yo' up at Cold Harbor, hey? But you uns got squah at Pete'sburg an' we won't talk about Gettysburg, but say! if you fit with Hancock you've got to take a drink with me, Yank, yo' have, fo' a fac'."

The crowd had been increased by about forty men and boys of all complexions, and they formed a circle about us, apparently interested in the "Yank," who in addition to that distinction was a stranger and therefore a legitimate object of curiosity, and with open mouths they awaited his reply. I took the proffered hand and hesitated. It would not do to refuse; and while not a total abstainer there were strong reasons for declining; the first was that the drink would be only the beginning of a series whereof the end could not be foreseen, and in which under no circumstances would I engage; and the second was the quality of the stuff that was being sold by landlord Wilson. Running this over rapidly while holding his hand I said: "I am very glad to meet you now, much more so than I was in the places that you have named, and I am only sorry that my kidneys will not allow me to take a drink with you in memory of auld lang syne."

"Durn yo' kidneys! I didn't ask them to take a drink, but ef yo' fit with Hancock, an' in the first division of his corps, red clover leaf, wa'n't it; yes, red clover, le's see, Barlow, yes, Barlow's division. O, I ain't dun forgot everything. Say, Yank, don't yo' think I'm drunk, I'm gwine win some ganda's yet, but yo' gwine drink with me, yo' is, sho'; here, boys, hyar's a Yank fit ag'in me an' mebbe the one 'at shot me in my laig; say, Yank, did yo' shoot me? Ef you did yo' got to take a drink, an' ef yo' didn't yo' got to drink with the old reb, ain't that so, boys?"

The crowd was unanimous, vociferously so, and to resist further would evidently give offense; so with the plea that ill health would not allow of liquid indulgences I capitulated on condition that "just one, in memory of the Wilderness campaign," should be all that I would be expected to take. Turley remarked that I made a poor looking sick man, and "he'd seen lots wuss."

"Whoop," yelled George Washington Simpkins, lifting his glass, "I didn't get no ganda, but here's to nex' time; keep yo' good eye awn the ole gray an' me ef yo' want to see a ole ganda's head fatched offen him in fust-class shape."

"Spec' yo' didn't hol' sand 'nuff in yo' han'," said old black Sam. "Ho, Miss'r Wilson! I'se des a-honin' fo' a drink, I is, fo' a fac'."

"Yes, let ole Sam have a drink," said Turley, "'twon't hurt him none; he's all right an' he hangs the birds to the Queen's taste; give him one awn me."

"He's right enough," said Wilson, "and I want to keep him so until the spo't is ovah and then he can have all he wants. Here yo' are, Sam."

"Fo' de lawd, Miss'r Wilson, but dat ah glass am small; spec' he's dun shrunk in de wash. Say, gimme bigga' glass en dat, I ain't had no drink dis ebenin'."

"Hurry up, the glass is big enough!" But when the landlord's back was turned Sam filled the second time and drained it with the remark, "Dat ah glass am 'ceedin'-ly small, it am, fo' a fac'."

The old darky was in good humor now, and went out singing:

"De jaybird sot awn de hickory lim',
He wink at me an' I wink at him;
Says I, 'Missa Jaybird, how de do?'
Says he, 'I'm well, an' how am you?'
Den git along, John, yah-ha-ha!"

Old Bill Turley arose to a point of order and remarked: "Wal, gentlemen, ef yo' all got yo' thirst quenched, I reckon it's time to feel the necks o' them ganders."

"No hurry," said the landlord, "the evenin's young yet, an' the ganda's ain't in no hurry. How's that, Sam, ah they all right?"

"Dey is, fo' a fac', Missa Wilson, an' dey doan git in no weavin' way 'bout gittin' dey necks puiled. Yah, ha! Dey ain' honin' fo' yo' all to git in de saddle, yah, ha!"

This gave the host a chance to say: "Now, gentlemen, yo' heah what Sam says, an' yo' all's got time to take one with me;" and without question as to choice of beverage the glasses were set out and the bottle followed. Sile Johnson, the ex-Confederate, was in the middle as they lined up, and, catching my eye, called: "Guide center! Heah, yo! dress awn the colors! you uns on the right touch elbows on the left! Gi' me that bottle! Wait fo' awdahs! Begin fiahing awn the left! Fire!" and he sent the bottle spinning down the sodden bar without accident. "Come up heah, yo' ole Yank," he continued, "yo' got to take one awn the house, 'deed yo' have; yo' kidneys must be dry by this time; heah, take the right o' the line!" It was the easiest, so I filled up with water and we all drank to the house.

As the party filed out they passed me in review, with Jo Bevins, the blacksmith, acting as my aid and advisor, a trifle exuberant but suppressed while commenting, and his criticism was: "Thah's Old Bill, straight as a string,

neva shows a dozen drinks more'n he'd show one. Sile's feelin' comfitable, but he's all right yet. Them two young sports shows it some, Kellum mo' an' Murphy; but I see 'em throw off an' make like they's drinkin' an' spill awn the flo'; they's both coatin' the same gal an' they's lookin' out fo' 'vantage. Look a' Simpkins! I knowed he'd git his kish full fust thing, an' he's got it; but he's a good hossman, drunk aw sobah, and he's all o. k. ef he stays joss so an' doan drink no moah; but he will. He'll git fuller'n a tick befo' he goes home, an' he'll—"Draw fo' places, gentlemen," called the young man at the table, and he held the straws in his closed hand while they drew. Sile Johnson drew the long straw and mounted his big bay. He waited until the gander ceased flapping and hung its head limp. Touching the horse lightly, he started, and the horse, glad to be moving again, increased his speed until two-thirds of the way was left behind, when Sile plied the whip, and the four white feet of the big bay seemed like a streak of light over the brown road. Within a few feet of the game the whip was dropped, the well-sanded right hand raised and the prize was won. The crowd, now increased to over 100, greeted the victor with a shout such as greeted a winner at the Olympian games. As he rode back he leaned from his saddle, picked the whip from the ground, and returning to the stand dismounted with the remark: "The ole man's with the boys yet, yo' bet." I congratulated him on his success and then we looked to see Simpkins mount. He was evidently drunk, but as Bevins remarked, "The hoss is sober," it seemed that there was no danger. He started, plying the whip with vigor, and a small boy encouraged the gray with a smart cut from a hickory switch; away he went, but before he reached the oak the gray was unmanageable and the rider tried to gain control without even giving the suspended bird a glance. The dust was seen a mile away, and a keen-eyed darky boy declared that his bridle had broken.

"The hoss 'll take him home all right ef he sticks on," said the blacksmith.

"Yes," replied Old Bill, "but what 'll his ole woman say? Golly, I wouldn't like to git it, an' not a feather to show her."

Turley walked quietly down the line until the boy with the hickory was reached. The boy was watching a squirrel running a rail fence near by and did not know of the coming danger until he felt a grip on his collar and his own hickory raising welts on his back. His yells scared the squirrel, who dropped a nut and made long jumps for shelter; the jays screamed and the other darkies yelled with delight. "Oh, Mistah Turley! I nebber done nuffin'; oh!" and so he kept it up until half a dozen had been dealt him and he went off crying. Turley never spoke, but as he returned the boys shrank back and several hickories were dropped; that part of their intended fun was spoiled; no other horse got a cut from the line of spectators, and I remembered that the blacksmith had said of Old Bill Turley that "He's one o' them quiet kind that 'tends his own business, but it won't do fo' any o' the smart fellahs to go projectin' 'round him," and from his business-like way in this matter it looked like a very just estimate of him. Several colored men muttered what they would do if their boy was whipped like that, but Old Bill did not hear, or if he did paid no attention to it, but certain it is that none of the grumblers went "projectin' around" Turley.

The other events were run without special incident, Turley getting two and Murphy the remaining two, and all hands went to the house again. I had lingered to observe several flights of wild doves as the sun was just dropping into the tree tops, throwing their long shadows across the field, and was watching a flicker approaching rapidly, closing its wings, falling and then catching himself, as if nodding, and rising again, when a little pickaninny informed me that "a gemman want yo' cum obah," and I started toward the tavern. On entering there were cries of: "Here he is now!" "Leave it to him!" "I'll stand by what he says!" and similar exclamations.

Half a dozen voices claimed attention at once, but on my suggesting that if only one would speak at a time a better understanding would be reached, Old Bill Turley stated the case: "They's a bet up an' it's left fo' yo' to decide, an' we want to know ef yo' see ole niggah Sam put up all the gandahs?"

"I did; I watched the operations closely, for it was all new to me and interesting."

"Did you watch him grease the necks?"

"Yes, I stood near him and saw it all and watched every start and noted each kill or miss."

"Did he grease 'em all, fah an' squah?"

"He did, he greased them all alike."

A shout went up and Kellum remarked: "Heah's yo' dollah, Sile," and then it transpired that he had accused the veteran of collusion with Sam and had bet that there was no grease on the neck of the gander that he had won.

There had evidently been hot talk and some danger of a fight, for the young men, Kellum and Murphy, began to show the effect of Wilson's whisky, but the two older ones were apparently as sober as if they had not drank once, although an hour before this Sile showed evidence of frequent potations. Now he was merely good-humored. Kellum felt it obligatory to celebrate his lost bet and asked the party to the bar, which, by the way, they never left. After the drink Sile seemed to feel it a trifle, and opened up war matters by saying to me: "Yank, did you shoot me in the laig in the wilderness?"

"No, my dear old boy, I didn't do it. In the first place I didn't know that you were there at the time, and in the second I never knew that Sile Johnson was hit. Then again, I did not shoot anybody, at any time, for I carried a sword that was never loaded, and just told other men when to shoot."

"All right, Colonel!" I was promoted at once. "I knowed yo' wouldn't shoot me, not ef yo' knowed it, but some Yank shot me in the laig when I was loadin' my gun an' hadn't shot at anybody nur give no provocation. Didn't hurt much nur lay me up long, but it showed a uenan spirit to shoot a man when he ain't done nothin', in't that so?"

I could heartily agree with him since my promotion, and as the landlord had whispered of some bottles of ringer ale found in some out-of-the-way place, for which he had no call, it gave a chance to ask Sile and his friends to join me, for I began to feel mean to be with such a party and not reciprocate after such kind treatment and so many invitations to join them; so calling up Sam, who had been left out somehow, I proposed his health as the

best master of ceremonies at a gander pull in Arkansaw, and Sam grinned, touched his hat, said "Thanks, Cunnell," and took his glass brim full. After this Sam was in for every event and sung and danced to the patting of a darky boy until his too liberal potations made him weary, and he curled up on a settee with no interest even in a gander pull.

The blacksmith drew my attention to the two young men who were arguing something at the end of the bar by saying:

"They ar' beginnin' to feel putty numerous, and them's the two I tole yo' was waitin' on one gal, listen!"

"I say 'tain't so!"

"You're a liah!"

Biff, and Kellum has the floor, with Murphy waiting for him to rise, as the Marquis of Queensbury has directed. Old Bill Turley quietly collared both, saying, "Boys, thar ain't goin' to be no fightin' 'less I take a hand. Now yo' all got to stop; yo' heah me?" Kellum was hot for satisfaction, and stated it as his opinion that he could whip any man in the house, old Bill Turley not excepted, and started for him, hands up. Turley took him by both wrists and held him as if he were a child, saying, "Yo' doan whip nobody to-night. Now yo' all take a good-night drink with me, get yo' gandahs an' go home."

In the morning as I passed the blacksmith's Bevins called out, "How did yo' like the gander pull, Cunnell?"

"First-rate; it's an intellectual game that I will try to introduce into Central Park, New York city, when I go home, under the patronage of the Cruelty to Animals Society, in order to divert the public from the brutal game of football; and a gander pull seems to be the only one that Northern women can't rob us of, because they are not strong enough in the wrist. Don't you think so?"

"I dunno, I dunno. Ef they take a notion they'll go at it on bicycles and use canary birds, ef what I heah about 'em is true."

"Perhaps so. I've had a good time, thanks to you for many points, and when I come this way I will always remember that old Bill Turley is the kind of a man that smart fellows don't want to go projecting around. Good bye!"

Natural History.

ENDLESS AND FLYAWAY.

WE were residing for a few weeks in an ancient marble palace, deserted by its builders many centuries ago, in the famous old city of Uxmal in Yucatan. On a Sunday morning an Indian field laborer brought to us from Muna, the nearest town, a forlorn little object in the shape of a yellow dog. Though not many weeks old, it had been made to trot several miles and was quite played out. On its face there were three moles, forming a perfect triangle, and the poor creature's tail had been chopped off by the persons in whose power it had been when it first took a peep at this world; they, like many of their countrymen, regarding a caudal appendage as unbecoming to their canine acquaintances. Some of the ancient Egyptians were of that opinion too, and closely curtailed their dogs.

In a letter of thanks to the priest who had sent us the small specimen of a native hound Dr. Le Plongeon thanked him for his Sunday sermon on Trinity, represented by the three moles, and on Eternity, suggested by the endless condition of the pup.

When the question of a name was discussed it was decided that we could do no better than to leave it as it was, Endless. This was afterward converted by the Spanish-speaking natives into Ingles (Spanish for English).

Three hot baths were required to free the smooth yellow coat from its thirty-three score of fleas. The cleansing process induced an appetite, and its owner, upon finding a dead rabbit which we had intended to incorporate into our own system, made the best of his opportunity. When we discovered our loss all our sympathy went out to the poor doggy, who with widely distended ribs lay gasping in a corner. Owing to his intimate connection with our rabbit we quite despaired of the pup's life, but his time had not yet come, so he grew in strength and beauty.

He soon became useful as a watchdog, and nothing was big enough to arouse his fear. He chased every creature that ventured upon the premises for a few days, and was a small terror to the domesticated fowl which we kept on hand for special occasions. However, we had not much difficulty in teaching him to discriminate, and thereafter he chased the chickens only for the fun of seeing them scared. He never annoyed the poor natives who used to come begging for medicines, each bringing some little offering, if only a flower. One day a girl presented us with a miserable specimen of a chicken, with few feathers and less flesh, which we had to accept. The bird never flew away from Endless, but insisted on perching on his back, dozing between his paws and sharing his food. Like a benevolent human being, the dog responded to those acts of confidence by constituting himself the chick's protector. Whether the dog nursing had anything to do with it we could not say, but as the bird flattened and expanded its feathers grew the wrong side out, making its wings appear as if turned upward, or spread for flight. Owing to this, we at first called that chick Angel, but certain visitors declared that was too shocking, and accordingly the name was changed to Flyaway.

To watch the two friends at dinner was vastly amusing. No sooner did Endless begin his meal than the chick drew near; then, just as soon as the small beak came in contact with some coveted morsel the canine foster parent would make a show of pouncing upon his protégé; only out of mischief, to see the small creature fly off with a cry of fright; in the end the chicken always got the pieces it preferred.

Later on a very sagacious black hen was added to our family party, and Flyaway tried to be adopted by her, but the only attention she ever bestowed on him was to give his small body a sharp peck when she wanted to vent her spleen on something that was not big enough to retaliate—so inhuman!

Our hen Negra turned out to be so brainy that we had not the heart to cut short her life; as for Flyaway, he was our dog's particular friend; therefore, when we left the ruins we carried the trio with us. During the journey we rested some hours at an old convent which had served

as habitation to the priest who had presented Endless to us. That amiable young dog was set free in a large, interior court; so were the birds, one secured to each end of the same string. When ready to resume our travels we could not catch the chicks, but the hound, seeing our efforts, took matters in his own hands and in a few minutes got the string between his sharp, white teeth and brought to our feet the rebellious poultry, indulging in a doggy war dance when he saw the chickens in our power.

In Merida, capital of Yucatan, the unfortunate Flyaway was condemned to death for habitual insubordination: he had insisted upon roosting on our dining table.

Endless made no attempt to hide his grief, and Negra then turned comforter. The yellow dog had grown rapidly, and when he appeared particularly depressed the sympathetic chicken would settle herself between his forepaws, leaning against his chest for half an hour at a time.

That gentle condolence was not misplaced. Endless reciprocated by taking into his large mouth the entire head of his comforter, who never manifested fear, but allowed the performance to be repeated again and again.

The first time we heard Negra uttering unusual sounds and saw Endless dragging her about the yard by one of her wings, we rushed to the rescue, but were only meddling with what did not concern us. By observation we became convinced that the hen had no objection to such sport, for no sooner did Endless let go of her than she would, while he lay stretched on the ground, carefully pick stray insects from his glossy coat and perch upon him in the most friendly manner.

We always thought that one day the nature of the beast might assert itself, for Endless was in fact a fine hunting dog, and very fierce; so that each time we saw his great jaws engulf Negra's head we asked each other, Has she really made her very last appearance in public?

She had not done so at the time of our departure; for on returning to New York we left dog and chicken, on the most friendly terms, in care of one of their admiring human friends.

ALICE D. LE PLONGEON.

THE COLORADO BUFFALO SURVIVORS.

DENVER, Colo., June 5.—The inclosed clipping is from yesterday morning's *Republican* of this city. It tells the story as it is now understood. I heard of the killing three or four days ago and knew that a deputy warden had been sent to investigate.

"Last Saturday C. W. Withington, deputy game warden, was sent from Denver to Pine Grove to investigate a report that some one had shot and killed a buffalo in that vicinity. He returned here Tuesday night and yesterday made the following report to State Game Warden Land:

"I went to Pine Grove to investigate the report of a buffalo having been killed near the place. On May 29 Mr. Jonathan Higginson was surprised to see three large buffalo bulls near his pasture fence, four miles below Buffalo Park, near Scraggy, about thirty-six miles from Denver. He noticed that one of the bulls was mortally wounded, so Mr. Higginson and one of his men followed the buffalo bulls about four miles. The wounded animal was bleeding at the mouth and side and could travel only slowly. It fell several times over logs, etc.

"Night coming on, they left him in a patch of timber and returned to the ranch. One bull had separated from the others and gone off by himself; the other stayed with his wounded comrade. That morning Mr. Higginson and his man went to where they had left the two bulls and found that the wounded one had died. The other was standing near it, but made off at their approach.

"Mr. Higginson skinned the buffalo, cut off his head, took the hide and head to the ranch and wired you. I claimed the hide and head for the State, shipped them to you and they are now here in Denver, to be disposed of as you may consider best. This buffalo was a very old one; he has a grand head, but his hide is poor. These three buffalo were undoubtedly driven out of Lost Park, probably by prospectors, as there are quite a number of men prospecting in that vicinity at present. Whether the buffalo was shot in the park or after he had got into the lower country it is at present impossible to state. There was a bullet hole through the paunch, one low down behind the shoulder and one near the point of the shoulder.

"I think from arrangements we have made we shall learn more about this shooting before many weeks are over. The other two bulls will travel back along the main ridge to their own range. As we have several good men on the lookout for us, we are certain to hear if they get molested in any way."

I have been trembling for this little band of buffalo ever since the new excitement in prospecting has been closing its lines around them. Within a month I inquired about them and learned from credible authority that when last seen they numbered sixteen. They belong in Lost Park, about sixty miles from this city, and I think have never been far from their very limited range in the last thirty years. Formerly they were frequently preyed upon by unscrupulous hunters, but in late years they have been pretty carefully watched. The permanent settlers scattered through the mountains in that neighborhood have learned to feel an interest in their preservation.

These buffalo are on an United States Forest Reserve, and the Government ought to fence in six or eight square miles of the tract, inclosing the herd, and by so doing preserve them. That would be a cheap and effective way of saving a natural wild herd upon their native range. These three bulls referred to evidently started off on a scout and one lost his life. He was very large and very old. The largest buffalo I ever saw was from this same herd, killed twelve or fifteen years ago, and is still in the collection of a Colorado taxidermist. There is another small herd of wild buffalo in this State. The last definite information I had about them they numbered eight. I believe I will not even tell the readers of FOREST AND STREAM where they range.

An 11lb. trout, native, was brought in from the Gunnison River yesterday.

WM. N. BYERS.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

FOOD OF THE BARN OWL

(Strix pratincola).

In a recent number of *Science* Dr. Fisher gives the following interesting results of his examination of the rejects of the barn owl. Facts such as these are worth remembering by sportsmen whose habit of carrying guns exposes them to peculiar temptation:

It is well known that birds of prey disgorge the indigestible portions of food, such as hair, bones and feathers. These are formed into balls, known as "pellets" or "rejects," by the muscular action of the stomach, and are regurgitated before a new supply of food is taken. The "pellets" contain the skulls, teeth and other parts of the victims, and furnish a perfect index to the food eaten. In a work on "The Hawks and Owls of the United States," published in 1893, I recorded the results of the examination of 200 "pellets" or "rejects" of the barn owl taken from one of the towers of the Smithsonian Institution, Washington, D. C., June 28, 1890. Since that time 475 more have been collected—125 Sept. 14, 1892, and 350 Jan. 8, 1896, making in all a total of 675 "pellets." This abundant material has been carefully examined and found to contain the remains of 1,821 mammals, birds and batrachians, as shown in the following table:

- 1119 Meadow Voles (*Microtus pennsylvanicus*).
- 4 Pine Voles (*Microtus pinetorum*).
- 452 House Mice (*Mus musculus*).
- 184 Common Rats (*Mus decumanus*).
- 1 White-footed Mouse (*Peromyscus leucopus*).
- 20 Jumping Mice (*Zapus hudsonicus*).
- 1 Rabbit (*Lepus sylvaticus*).
- 33 Short-tailed Shrews (*Blarina brevicauda*).
- 21 Small Short-tailed Shrews (*Blarina parva*).
- 1 Star-nosed Mole (*Condylura cristata*).
- 1 Brown Bat (*Vesperugo fuscus*).
- 2 Sora Rails (*Porzana carolina*).
- 4 Bobolinks (*Dolichonyx oryzivorus*).
- 3 Red-winged Blackbirds (*Agelaius phoeniceus*).
- 1 Vesper Sparrow (*Pooecetes gramineus*).
- 10 Song Sparrows (*Melospiza fasciata*).
- 4 Swamp Sparrows (*Melospiza georgiana*).
- 1 Swallow (*Petrochelidon*).
- 1 Warbler (*Dendroica*).
- 6 Marsh Wrens (*Cistothorus palustris*).
- 2 Spring Frogs (*Rana pipiens*).

A glance at this list will demonstrate to any thoughtful person the immense value of this useful bird in keeping noxious rodents in check. Moreover, judging from the species in the list, it may be seen that the barn owl hunts almost exclusively in open country, such as cultivated fields, meadows and marsh lands, where such pests do most damage. In Germany, according to Dr. Bernard Altum (*Journal f. Ornithologie*, 1863, pp. 43 and 217), the barn owl feeds extensively on shrews. In 703 "pellets," a number only slightly greater than that which I examined, he found remains of 1,579 shrews, an average of over two to each "pellet," while our 675 "pellets" contained only 54 shrews, an average of one skull to each 12½ pellets. On the other hand, our material contained the remains of 2½ mice to each "pellet," or 93 per cent. of the whole mass. The birds, which constitute about 4½ per cent. of the owl's food, are in the main species of little economic importance.

A. K. FISHER.

THE COPPERHEAD.

OAKLAND, Cal., May 24.—*Editor Forest and Stream:* There is considerable evidence in the late numbers of the *FOREST AND STREAM* that the snake season is close at hand. Indeed, two or three of your correspondents have already entered the field, and while they apologized in most cases for being a little premature, I regard that as merely a subterfuge to cover the fear that some one would get ahead of them.

Now, I am in search of a little information myself on that perennially absorbing topic, and where could I better look for it than in these columns? Doubtless you have a talented snake editor, who will be fully equal to the emergency; then there is Brother Hough, whose exhaustive researches into the hoopsnake enigma entitle him to a very high position in reptilian literature, and lastly, many astute correspondents, some of which I feel sure will not only be able but pleased to throw all the light required upon the subject.

What I want is a description of the appearance and habits of the copperhead. Not the genus with which so many of us were familiar during the late war, but the simon pure opidian of that name.

I have killed rattlesnakes in nearly every State and Territory west of the Missouri except in the extreme northern tier, and learned disquisitions, some of which declare this to be the only really deadly reptile in the United States, are to be found in all the large libraries of the land, but I have never yet seen a copperhead either living or dead, and when I began to realize this serious defect in my experience and started in to remedy it, I found such an inexplicable dearth of authentic information available that the results were of a most disheartening and negative character—that is to say that, although before the investigation I thought I had settled a few points about copperheads, I concluded afterward that I knew nothing whatever concerning them, and began even to doubt their existence.

[First I visited the reptile departments in the different museums in San Francisco, but while I found an abundance of snakes from all parts of the world I found no copperheads from our own country or any other. Then I consulted the encyclopedias. A search in the American was fruitless; they were not mentioned—at least not under that name. The Britannica briefly stated that they were a slow, venomous snake, usually found in wet places, under stumps, in swamps, etc.; but their habitat was not very definitely given, and as I did not believe they were found in England, Scotland or even Ireland, it was not quite clear to me how they could know so much more about them than our own savants. Finally I turned to the snake sharps of my acquaintance, and the enthusiasm with which my inquiries were received seemed to promise the most gratifying revelations. There was, in fact, every indication that I had at last struck the right trail.

One began by telling me how his grandfather and father had slaughtered them when they first settled in Indiana; another reported that the county in Kentucky adjoining the one in which he was born was just alive with them, and a third gave me a thrilling account of a

desperate fight one of his neighbors had with one that had attempted to drive him out of a 10-acre field. All this was certainly very encouraging, but when I pressed them to give me something from their own experience their eyes assumed a far-away look and they for the most part acknowledged that they had never seen one. One or two, whose zeal to impart information aroused a suspicion that their memory might be defective, declared that they had killed them when they were boys, but even they were unable to describe them in any satisfactory manner. None would say that they had personally known anyone who had been bitten by one, but agreed that in point of venom the cobra, rattlesnake or *fer-de-lance* was not "in it" with a copperhead.

In my boyhood the people of my section were firm believers in three remarkable kinds of snakes. The most formidable of these was the hoopsnake, with a spear or horn in the end of its tail so deadly that a wound from it was speedily fatal to all life, either animal or vegetable. This delectable creature was said to be so irascible that it promptly attacked anything that came in sight by taking its tail in its mouth, getting up on edge and sailing in with or without provocation.

Then there was the blue racer, with a white ring around its neck, very long and slender, and able to outrun the fastest horse by traveling along on top of the brush without touching the ground; and lastly the joint snake, which when pursued could separate itself into sections and make its escape by several different routes, resuming its normal condition at leisure after the danger was over.

All the solid facts about these phenomenally gifted reptiles were minutely instilled into my receptive brain in early childhood, but not a word was said about the copperhead, and although for nearly twenty years I have been a regular reader and correspondent of *FOREST AND STREAM*, the mystery enshrouding them is as deep to me as ever. Information from any reliable source will therefore be gratefully received, only the neighbor and grandfather variety being barred.

FORKED DEER.

[Notwithstanding our correspondent's doubts of the copperhead, it does exist, and this is its description: Hazel brown in color, the top of head bright coppery; back with a series of fifteen to twenty-five dark blotches, having something the form of an inverted Y; yellowish beneath, with dark blotches. It is 3ft. or more in length. The general form of the body is stout, and the head flat and triangular, something like that of a rattlesnake. The copperhead belongs to the genus *Ancistrodon*, of which there are two species, confined to eastern North America. The range of the copperhead is from New England to Florida, and from the Atlantic to the Mississippi. It is an inhabitant of the uplands and is sometimes called "highland moccasin." The water moccasin, which belongs to the same genus, is a common snake of the swamps of the South from the Carolinas to Texas; it seldom exceeds 4ft. in length and is said to be very venomous; it is an active swimmer. These species are closely related to the *fer-de-lance* (*Trigonocephalus*), which is found in South America and in some of the West Indian islands.]

BEARS IN THE NORTHWEST.

TACOMA, Wash.—*Editor Forest and Stream:* I read the paper by Dr. Merriam in the last number of your valued publication with keen interest. As bear stories are a never failing fund of amusement to the young, so also bearology (with apologies for the term) is an inexhaustible subject for study and investigation by the lover of nature.

There is no animal among the larger fauna of this coast which is more ubiquitous than the black bear. He is with us in force, and whether we wade the noisy stream in quest of the gamy trout, or thread the tangled mazes of the salal berry bushes in pursuit of the big blue grouse, our old friend *Ursus euarectus* is pretty sure to show up, either by signs or in his own person, before the day is done.

The vast hordes of salmon which twice annually swarm into every river and stream in this country fall easy victims to the skill of the sly old ursine fisherman; and his inordinate love of the sport of raking the pools with his long claws, and standing guard over a shallow riffle to flip a toothsome fish far out on shore, often overcomes his natural timidity, so that when intent upon his amusement it is often possible to fish right up to him. It has been my good fortune to gain very near approach to four different bears in this way in a single afternoon. And then in the fall, when nature spreads her bountiful feast of berries and fruits, old Mrs. Bear goes smashing around among the berry bushes with her double litters of cubs trailing after her, all scooping handfuls of fruit and leaves into their mouths and pushing for the fullest bushes.

Two factors tend to foster and protect the bears in this region. The first of these is the variety and abundance of the food supply, the second the impenetrable character of the cover. Incidentally it might be mentioned also that, with one exception, the hunters in this country have no trained bear dogs and do not hunt bears systematically. The mildness of the climate here, together with the fact that the salmon afford abundant food until after mid-winter, sufficiently explains the very short period of hibernation. Indeed, in favored localities the bear is scarcely in retirement, and one of the liveliest impromptu bear hunts I have had here was after Christmas.

Uncle Ursus was at home that day, all curled up under the burned end of a big fir tree, and a little lazy about getting his boots on for a run. He had dined sumptuously the previous night upon a good fat sheep, and his big soft bed of ferns was too alluring to leave. And so he lingered until my little spaniel Jimmy poked his nose against his furry ribs. Then he came out with a mighty snort, and amid a cloud of whirling leaves; and he was so rattled that he forgot to look for the owner of the dog and came rip, smash, against said owner's legs, and man, bear and dog got suddenly mixed up. If this particular bear had been endowed with the sense of a Bowery sneak-thief he might have got away unobserved among the confusion his sudden appearance created; but he did not sneak, he went for an adjacent tree. This hide shows a white patch under the throat, and I have observed this in many instances. Two cubs, litter mates, brought in this week, bear this mark.

Speaking of cubs reminds me that much confusion exists, even in the minds of pretty well informed persons, about the relative size and age of cubs when they are first brought out in the spring. They are seen here in late March and early April, and are then as large as a small

cocker spaniel. As they are born naked and blind, and do not open their eyes until 21 days old, they are at least 2 months old. At this time they are funny looking little fellows, with abnormally big ears and protuberant eyes, rather long tan colored legs and a somewhat scant coat of long grayish hair. They are lively fighters at this early age, and if you should essay to pick one up you will do well first to throw your coat over him. Neglect to observe this precaution cost a companion some pain and disfigurement last year.

The great majority of bears killed here are caught in steel traps. Few are still hunted, though this method is not impracticable. The hunter above referred to as the owner of a bear pack has killed very many bears before his hounds; but the last of this pack was killed by an irate bear last fall, and there are very few untrained dogs that will trail a bear.

In bear killing, as in any other kind of shooting, the question of caliber is intimately blended with holding on to the game. I have seen a bear shamle off into cover and be lost when shot more than twice by a .40-82 at easy range, and I have seen a bear dropped dead in his tracks at long range by a single .38-55 in the hands of a steady and accurate shooter.

We have a character here in the person of a Schwabian rancher, a native of the hill country of *Vaterland*, whose specialty is killing bears with a revolver; and his exploits in this direction are well attested, and his success quite phenomenal. He trapped an old female last March, killed her and her mate, two yearlings and three young cubs, all with his revolver and between sunset and dark. He handles the little weapon with great skill.

Michigan Birds.

CENTRAL LAKE, June 9.—Our first hummingbird was seen May 17. We thought that we heard one a week earlier, but were not certain.

I drove a few miles north last week on roads not far eastward from the shore of Grand Traverse Bay, and was much gratified at the sight of some of my old friends. There was a quail near the road and quite tame, also meadowlarks and bobolinks and a black squirrel, the last being very rare in this region. The quail have been living for a year or two not far from Norwood, and efforts have been made to protect them, with good results, but I do not think that they have yet become numerous—scarcely common.

The meadowlarks and bobolinks have been common twenty miles south of this village for a number of years, and have gradually worked their way northward along the roads, but have not ventured far inland—I suppose because the large bodies of timber seemed unattractive. These are gradually disappearing and soon the birds may take a wider range.

The catbirds, which for some years have built their nest in a bush close to our coffee mill (probably because they liked its music), have not returned this year and we fear the worst. There is a pair of orioles, however, and these, with the brown thrushes, make the morning air vocal when they are not too busy with their housekeeping arrangements. Robins are very common, and I think there are many more small birds about than ever before. Not a bluebird, however, has been seen. Yellowbirds are quite numerous.

At a more convenient opportunity I have a few words to say concerning trout, of which the catch seems to have been better this season than usual. Also of the trout-horse. Likewise regarding a farmer, a wolf and a hemlock knot.

KELPIE.

Feathered Strangers Near New York.

Editor Forest and Stream:

Dr. Grinnell's note in your issue of May 23 on the occurrence of the starling in Audubon Park recalls a rather singular experience I had in the upper part of New York city one morning in November, 1895. While riding down Riverside Drive my attention was attracted, near 112th street, by an unfamiliar bird note. It was a somewhat metallic, tinkling chorus, which I found was uttered by a flock of seventeen starlings perched in the topmost branches of the tall, leafless trees on the banks of the river. A few blocks further down I saw seven more starlings, and fancied I heard the flight-note of the European goldfinch, a bird which sometimes visits Riverside Park.

English sparrows, it is needless to say, were abundant, and I was mentally commenting on the fact that our city avifauna should be so largely composed of foreigners, when in one of the saplings bordering the Drive I saw a strange-looking, small, green bird which for a moment was a puzzle. On closer inspection it proved to be a Madagascar paroquet or gray-headed love bird (*Agapornis cana*). Doubtless it had escaped from confinement, but its plumage was in excellent condition and it flew with all the vigor of a wild bird. The English sparrows were much excited over the appearance of this newly-arrived emigrant. They had evidently decided that its presence was undesirable, and the poor little paroquet's first impressions of New York life were doubtless far from pleasing.

AMERICAN MUSEUM OF NATURAL HISTORY, JUNE 5.

Quail Breeding.

NEW YORK, May 20.—*Editor Forest and Stream:* For three years I have endeavored to raise quail in a small inclosure about 10ft. square and 2ft. high, covered with mesh wire, on the roof of a shed in the rear of my house. I put in 10in. of soil and have very good grass. It has been a failure steadily until this year, in the beginning largely through the food. The present pair I have had exactly a year and a half, and last summer they failed to mate, I think, because I had another cock in the same inclosure. However, this year they were alone and mated, built a nest under a board supported by two uprights, 3in. high, on which they invariably roost. About this I have some branches, and there was considerable dead grass, of which they built their nest, the male doing most of the work. There are, I think, nine eggs in the nest now.

I feed the birds lettuce, buckwheat and the half of an apple daily the entire year, and it seems to be the only food they thrive on; I have some very finely pulverized oyster shells in the tray with the buckwheat. I discovered their fondness for apples last year through feeding a rabbit I had in their place awhile.

Now if they should continue to lay and should hatch

any little ones, I should like to know what sort of food to give them while they are very young, and I thought some of your readers would be kind enough to give me the information.

A. G. FERGUSON.

[Feed your young quail, if any are hatched, on finely chopped hard boiled eggs for the first week, gradually adding to this fine bird seed, a little oatmeal and a little corn meal. You might try them with prepared mocking-bird food, and if you can do so give them ants' eggs. They need a fair quantity of animal food, which you can hardly obtain in attractive form in the city. Give us the results of your efforts.]

The Bluebirds.

DENVER, Col.—The bluebirds (*Arctic*) reached here this year Feb. 25, a week or ten days late. They were very plentiful for a while. A few days later there was a sharp snowstorm and the birds gathered about the houses—at least about mine. I counted at one time from a window upon the shrubbery at one side of the house fifty-four bluebirds, and they seemed about equally plentiful on all sides of the house. As spring advanced they scattered to the mountains. Only one pair, I think, nested upon my premises. The robins came two or three days later.

WM. N. BYERS.

ORO, Washington, June 1.—I presume the bluebirds here are *S. arctica*, as the males are all very blue. They are quite numerous around the mill now and I have noticed a number going into holes in trees; I think they hatch here.

LEW WILMOT.

ITHACA, N. Y.—I have tried to be alert and thorough in my search for the bluebirds, but thus far I have failed to observe a single specimen. In April I heard of one now and then, but I fear they have again avoided us. Orioles are more numerous than I have noted them in a decade. The finches, sparrows, larks and grackles are with us numerous, as usual. A recent visit to Lansing, Mich., convinces me that nearly, if not quite, all the birds familiar to western and central New York are to be found in and about the beautiful Capital City in goodly numbers. But the bluebird abideth not there, apparently.

M. CHILL.

The Distribution of the Bobolink.

ENGLEWOOD, N. J., June 6.—*Editor Forest and Stream:* Twenty years ago bobolinks were abundant summer residents in this vicinity. Now they occur only as spring and fall migrants, and for the past fifteen years I have not seen them during the breeding season. Whether their disappearance is purely local I cannot say, but the nearest nesting bobolinks I know of are distant about ten miles north of this place, on the New York—New Jersey State line. The cause of their disappearance is simply a matter of conjecture. The killing of immense numbers of these birds as reed birds or rice birds each fall by gunners and rice growers may have had some effect on the species as a whole, but the result would not be likely to be evident locally. Their decrease may be due to trapping during the mating season. I have heard a New York dealer in game birds say that he received about 600 bobolinks from Long Island every spring. Or, as in the case of the dickcissel, it may be due to some more far-reaching and obscure cause. At any rate, the subject seems of sufficient interest and importance to warrant a call for information on the present distribution of our bobolinks, in order that subsequent changes may become more apparent and perhaps intelligible. I hope, therefore, that your correspondents will record any pertinent notes they may have.

FRANK M. CHAPMAN.

Band-Tailed Pigeons.

THE question which recently came up as to the occurrence in Washington and in British Columbia of the passenger pigeon (*Ectopistes migratoria*) appears to have been settled by the notes, printed last week, from Dr. Beebe and from Mr. John Fannin, curator of the Provincial Museum at Victoria, B. C. These contributions are to the effect that the wild pigeons referred to by Dr. Beebe were, as we suggested in a note appended to Dr. Beebe's original inquiry, the band-tailed pigeon (*Columba fasciata*). If further confirmation were needed it may be found in a skin of one of the birds, kindly sent on to us by Dr. Beebe, which is that of a male band-tailed pigeon. This species occurs commonly on the west coast of North America from British Columbia south to the highlands of Guatemala.

Game Bag and Gun.

AFTER TWENTY YEARS.

NEARLY everyone has heard more or less of the wonderful purity of the air in the West; how fresh meat can be left hanging for weeks and remain pure and sweet, and how a barrel of water left standing exposed to the air accumulates no foul matter or "wrigglers," such as take possession of water left so exposed in an Eastern climate. Many claim that the purity of the air out there accounts for the fact of such a preponderance of honest statesmen sailing from the West. Be that as it may, the following illustrates the wonderful qualities of this air better than any authentic account I have yet seen.

In the winter of 1873-74, in company with three others, I was camped on the Middle Loup River, in Nebraska, well up toward the mouth of the Dismal. Our occupation was hunting. We had a comfortable camp of red cedar logs and plenty of dry cedar logs to keep our fire napping and glowing. Late in the winter our occupation grew to be nine-tenths sleeping, eating and playing even-up, with an occasional trip into the hills after elk, deer or antelope to keep up our fresh meat supply.

Along in the early part of the winter one of the boys had killed a huge whitetail buck, the largest I ever saw. The flesh of this old fellow was very tough and we kept it on hand to use when there was nothing else in camp and to give to farmers who came up from the settlements a hundred miles below to have an outing and get a load of meat. These people invariably struck our camp entirely out of provisions, and we would not only feed them while they stayed, but provision them for the return trip.

Toward spring the carcass of the old buck had been worn away until only the neck was left, and that was

so tough that human ingenuity could reduce it no further.

One evening just before sundown a party of farmers drove up to our camp, and as was usual with this kind, they were out of provisions. We fed and lodged them, and when they left supplied them with flour and coffee, and for meat gave them the piece of neck.

Across the river and some four miles away was another camp like ours—out for the winter. The farmers went from ours to this camp, and as it chanced found them out of meat, and out of their abundance (as they claimed) gave them a piece, the neck, and went on their way rejoicing. Some two weeks later a party arrived at the camp across the river from the lower regions, as we called the settlements, and they too were out of provisions. On leaving their acquired stock consisted of flour, coffee and buck's neck.

From that camp the outfit came directly over to ours. They arrived just before supper and we were obliged to apologize for being out of meat. They promptly volunteered the meat and produced the neck. I recognized the old fellow in an instant, and taking it passed out as if to slice some for cooking. Luck was on my side, for as I stepped through the door I espied one of the boys who had been out hunting just coming down the cañon with the tenderloin of a fine young black-tail buck he had killed. Going to meet him, I posted him to keep still and sliced the tenderloin for supper.

It was comical to see the look of wonder on the faces of our guests as they tasted the juicy steak, but they did not dare to give themselves away; and I think it must be a wonder to them yet how the thing was done.

On breaking camp in the spring we left the piece of neck on the chopping block, and until this year, 1896, I have never revisited the place.

This spring fate, with her sails set for distant climes, took me on board and carried me into that neighborhood and I took a "stop-over" for a couple of hours and revisited the old camp ground. I had a grand time visiting with those wrinkled old hills. The spot seemed hallowed to me, and as I wandered about many scenes and adventures in which I had been a prominent actor came drifting by on the flood tide of memory. I gazed long at the mouth of the cañon out of which came the first elk I ever drew bead on. That elk may be alive yet for all I know to the contrary.

Wandering from the camp site, I follow up a divide to the south and east down which I have tramped through the gloaming many a night in the long ago, returning from the day's hunt. A mile and a half from the camp site I climb up and out on to what I used to call the table basin.

The table is about 300ft. above the level of the creek, a mile to the west, and contains 400 or 500 acres of fine land. The land is all under cultivation now, though there are no buildings on it, the buildings being down near the creek, where water is more accessible. At the south end of the table is where I had laid my first elk low.

From there I made my way far to the westward to the scene of my most signal success in all my hunting experiences. As I approach the place I come upon a deserted frame house standing on a level piece of ground, where a huge cañon widens out into some semblance of a valley. Here some wanderer from the East had settled with his little family, built his house and planted trees, laying out his grounds and preparing the soil for crops, with fond hopes of future peace and plenty; but alas, for his expectations! he was a little too far out of the rain belt and after years of trial was obliged to leave his little all and seek a more favored clime.

I seated myself on the deserted doorstep and pictured to myself some of the labors, hopes and despairs this settler must have undergone. The spirit of the departed settler (departed East to live with his wife's father) hovered near and whispered tales of privation into my sympathetic ear, and then the wheels of time turned back another decade; the doorstep crumbles away beneath me and I find myself lying prone on the prairie—not in a valley, but on a hill. The air, which had been sultry all day, has suddenly become cool and invigorating; the sun, which last instant was halfway down the western slope, is now just peeping above the eastern horizon, casting its first glint of gold across the frost-bejeweled blue stem.

But what is this awkward yet familiar looking thing I am holding in front of me? It is evidently a gun, the stock of which extends nearly to the end of the barrel, and is held in place by three iron bands. It has a huge hammer, underneath which a curious little lever is locked. Ah! I see, it is my old .50-70 needle gun.

Yes, and just across the cañon on the next hill, 150yds. away, his red sides ablaze in the morning sun, stands a huge elk. Just now, too, I hear the rattle of horns and realize there are more of them in the cañon below, two of whom are settling some difference of opinion according to the code.

How I would like to be up where I could look over the wall at them. But I am as far as I can go in that direction without being discovered by the old fellow on the hill, so I content myself with taking a good look at him and then leveling the needle gun on him and pulling the trigger.

I hear the bullet spát on the elk's ribs, emitting a sound much as if he had been struck with a barrel stave. I see him flinch, even at that distance, and then he turns his head slowly toward me as if to reproach for the pain I have caused; then, without warning, his legs suddenly shoot into the air and he is down.

The rest (there proved to be six of them) run down the cañon a couple of hundred yards and come out on a small knoll, where they stop to take observations. I get in several shots before they conclude to move on. What happens after is a confused jumble of running and shooting.

Accurately to describe it would be as impossible as for one to look at the monuments on the Custer battlefield and then accurately describe the battle. When I come to myself I am three miles from the starting point and have three elk down, the last with seven bullets in his carcass and brought to earth by the last cartridge in my possession. I immediately hasten back to camp to get the boys to help dress the game, but alas! ere I reach it, time has resumed her normal flight and I find the boys and the camp, like the Indian's stove after he has kindled his fire with gunpowder, "A heap gone."

Wandering around the camp ground I fell to searching

for relics. The logs of the cabin had long since been removed by settlers, and the only thing to mark the spot is a depression where the cellar was, though I could have located the place from the lay of the ground. The only thing I find that seems to belong to the "old days" is the hull of a Spencer rifle cartridge; this I know to have been fired from the gun of that make I attempted to use when I first came out here. The extractors of this gun had a habit of taking a piece out of the hull and leaving it sticking in the gun. The hull I find is so marked and I am satisfied.

Down on the bank of the stream I come to the place where the old chopping block stood. The block has completely rotted away; there is only a reddish cast in the soil from the fiber of rotting wood to mark the spot; and yes, there is something else, 'tis that piece of neck, seemingly in as good repair as when I left it there twenty years ago.

I examine it and find it sweet and tough, as the broken blade of my jack knife will testify. In a circle round the center I find the skeletons of fifteen wolves, each with nose pointed to the center. The story of their sad fate was plainly audible; they had starved to death trying to get a meal off that neck.

Now when anything new or wonderful is discovered or told there is sure to be some "Doubting Thomas" who shouts fake or humbug; but any such can have their doubts subdued, for on application I will send my broken jack knife to be inspected by any one.

No communication will be noticed unless money is inclosed to pay freight both ways.

GENESEO, Ill.

E. P. JAKES.

CHICAGO AND THE WEST.

The Ways of Some Wardens.

CHICAGO, ILL., June 6.—A business man of Chicago writes to call attention to the manner in which the game warden of Iron county, Wis., is discharging his official duties. The gentleman states that he has direct information that this warden found a party, including a Mr. Caldwell and guide, in possession of muscallonge while in camp on Fisher or Cedar Lake during the early part of May, and proceeded to read a warrant for their arrest, but compromised the matter with them directly on the payment of \$75. This warden is a saloon-keeper in the town of Mercer. It is said that some of the county officers of Iron county enjoyed considerable good muscallonge fishing during the last two weeks of the closed season. But I fail to understand the comment of my informant, who says, "There is more or less excuse for this, as nearly everyone in the district feels that the closed season should end on the 10th of May." It would be very convenient to break a good many laws which do not suit us personally, but if we followed out this idea we would have no laws at all, and no fish at all.

Mr. Chauncey M. Powers, of Decatur, Ill., is not strictly happy over the result of the little attempt on his part to do some game protection. Mr. Powers and his brother had noticed many violations of the duck law at Spring Lake, Ill., this spring, and wrote to Warden Blow to learn what he could do in the way of stopping them. Warden Blow replied that for the sum of \$30 he would go to Spring Lake and stay for a number of days and clean up all the violators. The \$30 was sent him, but apparently fell into the middle of a deep silence. The duck season has passed and spring has merged into summer, but no Blow and no \$30 has yet appeared in the vicinity of Spring Lake. Not this spring, but perhaps some other spring.

Bird Lime.

Justice Smith this week fined S. Derling and H. Boreinger \$5 and costs, each for trapping song birds by means of bird lime. They were using a sticky substance which they placed on twigs about the nests of the song birds, thus taking them when they alighted near the nest. The justice told the men that if they resumed their industry he would fine them \$100.

The Mills of the Gods.

For wisdom and justice in large solid chunks, apply at the office of a country justice of the peace when a game law case is before him. A recent instance at Elgin, Ill., may be cited. Mr. Fargo, of Chicago, had lost overboard a fine Westley Richards gun in the Fox River at that point, and employed some net fishermen there to recover it for him. The men took a seine and went fishing for the gun, which they are said to have recovered early in the evening. Yet they continued seining until 1 o'clock in the morning, at which time they were caught by Warden Blow. The justice before whom the case was brought discharged the men on the ground that they were still seining for the gun, from force of habit.

National Park Buffalo.

Mr. John W. Cowan, of Butte, Mont., who is in the city this week, says that he thinks the herd of National Park buffalo is about wiped out. He believes this from reports which have come to him from south and west of the Park. Mr. Cowan and others are making strenuous efforts to stop the slaughter of deer in the Flathead country. He says that 7,000 deer were killed there in one winter, two years ago.

From Cincinnati.

Mr. W. W. Peabody, Jr., manager of the coal traffic of the B. & O. Southwestern Ry., spent part of the week in Chicago. He states that he has become a fisherman besides a field shooter, and recently had a good take of bass in the White River of Indiana. It may be remembered that Mr. Peabody was the head of the special car party whose doings in Texas, winter before last, were recorded in the FOREST AND STREAM. He says that the party must unite next winter for another trip to the same country.

From Texas.

Mr. O. C. Guessaz writes from San Antonio, Texas, and gives some facts in regard to the canvasback situation at Lake Surprise, near Galveston. He states that banker Moody, of Galveston, had eight market hunters hired last season to shoot for him on the canvasback grounds of which he has gained control. One of these hunters writes to Mr. Guessaz that last winter he killed 5,000 canvasbacks to his own gun. Credible information also comes from Mr. Guessaz that banker Moody cleared up \$7,800 last winter as profit on his market shooting. He is

said also to have made \$300,000 in cotton deals, so that it would seem that he could manage to worry through the year if he is economical.

There is no doubt that a very fine canvasback preserve is thus kept closed against the shooting public. So far as the birds are concerned, however, I am disposed to believe, from personal acquaintance with the locality mentioned, that they are better off the way it is. If those waters were thrown open, they would soon be shot out. To be sure, a great many of us would have a great deal of fun while the process was going on, and to be sure also the shooting would be in the name of sport and not of the market; but the end would be the same, and it would only be reached more quickly. My friend Mr. Guessaz can tell us something of the size of the bags made by Northern shooters on the Texas coast when the flight is good, and can reason out what 100 such shooters would do on Lake Surprise in the course of a season. I think he will agree with me that a limited bag is better to-day for sportsmanship than the addition of ducking grounds, no matter how good or abundantly supplied they may be. I have seen the game go from so many apparently inexhaustible localities that I begin to be afraid for the game supply of Texas, to which the tide of shooting travel has of late turned so strongly. It is going to be Dakota over again. I should like to see Lake Surprise in the hands of a club of sportsmen who would limit the bags to not more than fifty birds a day, which I personally believe is enough for a sportsman to kill at this stage of the game supply in the United States. That so much game is sent to the markets, to be eaten as food by men who are not sportsmen, is the great cause of the scarcity, as I am persuaded all must believe who understand the facts. When the millennium comes we shall have no game market, and the sportsmen will stand around Lake Surprise, each contented with a bag of twenty-five birds—when the millennium comes.

In It.

Mr. H. A. Newkirk, of the Chambers Glass Company, writes to state that he believed it might be gratifying to the publishers of FOREST AND STREAM to know that in writing to seven different sporting goods manufacturers he had occasion to state that he saw the advertisement of each in FOREST AND STREAM. The leading sporting goods houses of the United States are in FOREST AND STREAM, and those who are not in it are out of it so far as competition in the trade is concerned. E. HOUGH,

1206 BOYCE BUILDING, Chicago.

IN JACKSON'S HOLE.

In Four Parts—Part Two.

JACKSON'S HOLE comprises a territory about sixty miles long and twenty miles wide. It is completely shut in by tall and rugged mountains, and seems to be an amphitheater especially created by the great and just God for the habitation of his creatures.

Here upon the rolling prairie and in the dense fir forests the moose, elk, deer and antelope roam in solitude, being disturbed only by an occasional visit of some hunter or wandering band of Indians. The basin is well watered. Jackson's Lake, a body of water twenty miles long and five miles wide, lies in the extreme northern end, and the South Fork of the Snake River takes its origin in this lake. Snake River runs the full length of the basin and is fed by dozens of smaller streams, which are the outlets of numerous small lakes. Thus the entire Hole or basin is interspersed by a network of small lakes and creeks, which all empty into Snake River. We were charmed with the prospect.

We had obtained a good view of the basin from the side of the mountain as we descended, and one and all declared that if we did not find game here there was no use looking for it in America. Old Ed declared that every man in the party should have the opportunity of killing more than one elk, and then if he did not take advantage of it the fault was his. Ed said that two years ago he guided a couple of Chicago railroad magnates to Jackson's Hole. (I will not give their names, as one of them might read this and come back at me.) They came out to Yellowstone Park in a private coach, left their families at one of the hotels in the Park, and came to Ed's house to be guided to Jackson's Hole on a hunt. They bought a whole drove of pack horses and had champagne and cognac, and two cooks and valets and numerous superfluities. Ed said that he hunted with them faithfully, and jumped elk and deer and antelope by the drove for them, but they could not hit the side of a house with their rifles. They were both strangers to the use of a rifle. So the hunt was without success—excepting what he killed for them. We assured Ed that if he would show us the game we would get it, and so the bargain was made.

The mountains on all sides are split up with immense cañons or gorges. Out of each one of these cañons rushes a mountain torrent that rushes and tumbles to the river below. Up in these cañons, many of which run far back into the mountain range, live bear, elk, moose and black-tail deer. Moose, elk and deer also inhabit the dense fir forests that border the lakes. They very rarely go out on the open prairie.

On the morning of Sept. 9 we were all in the saddle by daylight. Up to this time we had got only the two elk that we bagged in the Bitter Root Mountains; so a more ardent lot of fellows would be hard to find. Ed told us to go in pairs and we would be more apt to find game than for all to go together. Ed and Dr. McReynolds were together, Cooke, McKamy and F. Gardenhire formed another set, and S. Wester and I were to hunt together. We all took different routes. Sam and I rode for several hours across the prairie, passing through numerous belts of timber that bordered the creeks. We saw several large droves of antelope, but could not get in rifle range of any of them. Finally about noon I rode out of the bed of a creek, and as I mounted the other bank I got into the middle of a drove of antelope. I threw the reins over my horse's head, jumped to the ground, and firing as they scampered off I got a large stag. About this time Sam came up and we skinned the antelope, and taking his hindquarters with us went on. We hunted the rest of the day without success, and returned to camp at dark.

Before long all the boys were back, and Dr. McReynolds came riding in with the hindquarters of a big moose tied behind him, while Old Ed had the hide rolled up and a side of moose ribs tied behind his saddle.

We gathered to hear the Doctor give an account of his adventure, and Old Ed said he never saw a man slide off

of a horse and pump a Winchester any faster than the Doctor did. They had gone up one of the old cañons to a favorite hunting place that Old Ed knew, and he had found the game for the Doctor. Ed sighted the moose as she was browsing on the bushes, and the Doctor sprang from the saddle and shot her before she ran. As she ran off he gave her another bullet from his .50-95 Winchester express rifle, and that stopped her. We were certainly a happy crowd. A moose the first day. Think of it!

We all set to work now to help the cook, and before long were seated to a grand repast of moose steak, hot biscuit, vegetable soup, fried trout and broiled prairie chicken. Our camp was on a creek and Will Johnson had caught a waterpail full of trout as fine as I ever laid eyes on. We dreamed of hunting that night, and the goddess Diana seemed to be smiling upon each member of the party and whispering in his ear, "You can hunt now to your heart's content."

Next morning, the 10th, by daylight, we had breakfast over and camp knocked down and packed in wagon to move. We were to move up the valley about twenty miles, so as to get better grass for our horses and equally as good hunting. Ed directed our course toward Jackson's Lake, and about noon we drove into a shady nook near the base of Big Teton Mountain and about six miles distant from Jackson's Lake. This nook was a small valley hemmed in on one side by a large foaming creek bordered by magnificent trees. The valley comprised about 200 acres, shut in at the rear by the foothills of the Big Teton Mountain and on the front by the creek. So our camp was entirely hidden from any passing band of Indians or trappers. The bunch grass was waist high, so the horses had plenty of forage. We camped on the bank of the creek and erected the tents in a fine grove. Ed said that this would be our main camping place, so we could spend the rest of the day in making ourselves comfortable. We followed his example and soon had benches made and shelves nailed against the trees for wash basins and water-pails, with a rough table to eat upon. Then every man cut a good supply of the tall grass, or rather hay, as it was cured at this season, and made a good soft bed in his tent. We also erected a good strong fork on each side of our camp-fire, and by laying a heavy pole in this fork could roast or spit sides of ribs or quarters of game. After we had erected and arranged the cooking tent and put up the small sheet iron stove we were comfortable.

That afternoon we fished for a couple of hours and found that the stream was literally alive with trout. We were glad of this, as it would be the means of passing away many a pleasant hour when not engaged in the chase. We were surprised to find the trout so large; Wester and Cooke caught several salmon trout that weighed over 5 lbs. each. I tell you if you land a 5 lb. trout out of one of those tumbling, boiling mountain streams, and keep him from sawing the line in two against the rocks, you are an expert. It is not so easy as it is to draw one in from the placid surface of a lake or sluggish stream. I have seen Sam Wester get so excited that he would forget everything on earth except that trout on his hook, and if he could not get his fish any other way he would go into the water with his clothes on after it. There is nothing like this in the way of sport unless it is to bring down a big elk or moose as it leaps through the forest.

All the boys were in the saddle by daylight eager for the chase. They divided up in pairs, and each pair took a different route. I remained in camp on this day, so as to allow Will Johnson a day to hunt. I busied myself during the day arranging small details of the camp to my own satisfaction, and in the afternoon took Sam's shotgun and walked out a short distance on the prairie to shoot chickens. I had all the shooting I wanted, and brought back as many birds as I could conveniently carry. I also caught a nice string of trout, and at 5 P. M. put dinner on. I spitted the side of moose ribs, and with baked trout and broiled chicken, and antelope steak and a goodly variety of canned vegetables, had an elegant repast waiting for the hungry hunters. All the boys were in by 7 o'clock, and one and all declared that I had done my duty as cook. I have lived in camp a good many years in following the civil engineer's profession, and learned something of camp cooking. The bag this day was light. Will McKamy killed an antelope and brought it in whole. All of the boys had seen numerous fresh signs of elk and bears, but had sighted nothing, not even a deer.

We slept soundly that night and all hands were in the saddle at daylight. A more energetic and enthusiastic party was never in the woods. Ed, Dr. McReynolds, S. Wester and B. Cooke were formed into one party, and McKamy, Frank and I formed the other. Trafton was to guide his party to another of "his favorite places," as he called them. Old Ed grinned and said, "Boys, if I don't show you game to-day you need not pay me my week's wages." That reassured us, as we knew Ed would not make such a rash proposal as that unless he was sanguine of success. Will, Frank and I hunted hard all day. We traversed forest and cañon, foothills and the open plains. We got a scratch shot at a big black-tail buck, but failed to stop him. We followed one elk trail eight or ten miles back into the wilderness, but failed to come up with them.

We returned to camp empty-handed. About dark the other party got in, and old Ed was true to his promise; he had found game for them. They had killed a bear and two black-tail bucks. Dr. McReynolds killed the bear and Sam and Bob killed a buck each. The boys brought in the bear skin, his hindquarters, and old Ed saved all of his fat. Sam brought in his buck, but Bob left his in the woods. When he shot the buck it tumbled over a precipice, and as it was getting late they did not go after it. Sam says they could see the deer stretched out dead on the rocks below them; but it was too late to get it out of the gulch; so they left it. Bob said he would go back some time and get the horns, as it had a magnificent head. We were all very much elated, and declared old Ed to be a jewel. In a party like ours it was as much pleasure to see our companions successful as to be the lucky man. We were all warm friends, and there was no rancor nor petty jealousy to disturb the equanimity of any one.

We feasted that night, sang songs and helped old Ed scrape the bear hide and render up the fat into oil. Ed was in for saving his winter supply of grease or substitute for lard. He said every gallon of bear oil and every pound of elk tallow that he took home with him would save him money the coming winter, and as we did not want the stuff we were glad to see him utilize it.

The 13th was an unsuccessful day. We only killed a small antelope and some prairie chickens. We waged unrelenting war against the porcupines, because they would come to our camp while we were asleep and gnaw our saddles and harness. The porcupine is death and destruction to leather, and I would advise anyone going into this country to take a good watch dog with them. Ed had a good one at home, but had left it with his wife for her protection.

Sunday we all remained in camp and rested. We had our usual morning exercises and a short sermon from Dr. McReynolds, which we enjoyed very much.

On the morning of the 15th Bob Cooke said he wanted to hunt on foot and alone that day, so he shouldered his rifle and departed in the gray dawn. Ed, McKamy, Frank and Johnson went together, mounted, and Wester and I hunted together, also mounted. Dr. McReynolds remained in camp. Sam and I hunted until noon, and as we did not start anything returned to camp and put in the balance of the day shooting chickens and fishing. We had great sport at this, and when night came had a goodly supply of both.

Bob Cooke had an unsuccessful day; although he emptied his magazine at an old cow moose, he could not stop her. Bob says the timber was so thick that his bullets buried themselves in the trees instead of striking the moose. He fired nine times at her and did not draw blood. When Bob Cooke shoots nine times at an animal and does not kill it there was not much chance. The other party reached camp about 7 o'clock and had the hindquarters of a large cow elk and one side of ribs, and Old Ed had his usual supply of about 40 lbs. of tallow. We could all tell that Frank had something to do with the killing, for he came in whooping. It seems that the party had very unexpectedly started a large band of elk, some thirty or more, and the only fair shot obtained was the cow that they killed, as she was separated some distance from the others. Will McKamy and Frank were in advance of the other two men and both fired twice at the cow. They brought her down and she had three bullet holes in her, so both had hit her. Frank says two of the bullets that struck her were his, and so that he killed the elk. But as both Frank and Will used the same caliber rifle we decided that it was a draw and both were entitled to the glory. We finally let up on Frank and peace and good will were established again.

We had a good dinner that night and made an extra spread, as this was the last dinner Dr. McReynolds was to take with us. We all wrote long letters home to our wives and dear ones and gave them graphic descriptions of our hunt.

On the morning of the 16th, long before day, Dr. McReynolds was on the trail leading back to Ed Trafton's house. He had eighty miles to travel that day, as there was no place he could stop until he reached Ed's house. He made it, however, that night about 10 o'clock. What Eastern horse would carry a man eighty miles in one day?

The morning of the 17th Ed said he would take us to Jackson's Lake, as he had often killed elk in the thick fir forests that border the lake. Bob Cooke took his rifle and hunted alone. The other members of the party followed Ed. We took a circuitous route to avoid the dead timber, which is very difficult to get through, and arrived at the lake about 9 o'clock. We hunted in the tall and stately fir timber for about an hour, riding along slowly and keeping a sharp lookout. All at once, Old Ed, who was in the lead, stopped and pointed his finger. We looked, and not more than 75 yds. from us stood the finest specimen of an elk I ever saw. Several of the boys saw him at the same time, but before any of us could dismount and take aim he was gone. About three of his tremendous leaps put him out of sight, as the timber was very thick. This bull was the finest one we saw on the trip, and had a magnificent set of horns. Many were the regrets that some of us had not been a little quicker in action. We started several more elk that day, but had bad luck in obtaining shots. Not a single man got the chance to shoot. In returning home we followed the beach of the lake for some distance and came upon a trapper's hut. There was a large black-tail buck hanging to a tree close by, and all the trapper's outfit in the hut. We stopped long enough to fry some venison from his deer and make some coffee out of his supply, then continued our journey. We noticed a large number of very fine fish heads on the ground near the hut; so it proved that there was fine fishing there as well as hunting. The fish heads were much larger than any we had caught. Ed said that the lake was noted for its fine trout, and that he had seen trout caught out of it that weighed as much as 15 lbs.

We reached camp that night empty handed, as we had not killed as much as an antelope. We had seen a magnificent body of water, however, and the sandy beach and boggy spots along the lake were full of tracks of every variety of game, from deer to bear. We knew they were there; all that was required of us was to find them.

A. B. WINGFIELD.

[TO BE CONTINUED.]

FROM THE YELLOWSTONE PARK.

LAST March two Livingston, Mont., poachers named Sheffield and Vance were arrested by the authorities in the Yellowstone National Park for killing elk in the strip north of the forty-fifth parallel. They were tried before Commissioner Meldrum at the Mammoth Hot Springs week before last, and on Thursday, June 4, were convicted and fined \$75 each and costs. The two men made a strong plea that they were unable to pay this fine, so the Commissioner reduced it to \$50 each, which they managed to raise and to pay. This makes elk meat come pretty high.

The season in the Park is very backward, and there is still a good deal of snow. The crew who are at work on the roads only reached the Lake Hotel June 5, and it will take them some time longer to get over the divide.

The country is full of game, and great numbers of young animals are seen every day. Elwood Hofer, the Smithsonian hunter, is at Yancey's catching young animals for the National Zoological Park at Washington. He has taken four antelope and five elk, and could get a great many more of these last if he wanted them.

Usually travel begins in the Yellowstone Park soon after June 1, but the indications are that this year the season will open late.

Connecticut Game Birds.

HAMDEN COUNTY, Conn.—If signs are to be relied upon then in this section there will be a greater abundance of game next fall than there has been for a number of years.

Woodcock are with us at present in greater numbers than usual, while drumming partridges can be heard on every hand. The mellow call of Bob White comes as of old from wood's edge and bar rail. They certainly are thicker than they have been in the past ten years.

We have a stranger with us this year—the Mongolian pheasant. During the past two years a number of these birds have been released in this neighborhood. Within sight of where I am writing this note a very interesting family, consisting of father, mother and a brood of a dozen young birds, are to be seen almost daily. They frequently mingle with the barnyard fowl. Besides this brood there are a number of old birds about. It is greatly to be regretted that the three-year law prohibiting the killing of this new addition to our list of game birds expires with the opening of the shooting season. It seems a pity that they should no sooner start to increase than the work of extermination should begin.

The increase in partridges is undoubtedly directly attributable to the aggressive activity inaugurated against the snarers last fall. From all accounts it was rather an unprofitable season for them. This activity will not be allowed to lag, for these lawbreakers will be watched closer than ever this year. WM. H. AVIS.

Camp Comfort.

AUGUSTA, Me., May 21.—Mr. W. H. Gannett, one of our leading citizens, has built recently a log cabin on Capitol Hill. It is within a mile or so of the city, and is a model retreat when a business man yearns for a little rest and recreation. It is made of logs from $\frac{1}{2}$ to 2 ft. thick, and the roof is protected by two layers of cedar splits.

The panes of bullseye glass in the gable window are over 100 years old and attract much attention.

Mounted deer and caribou heads adorn the walls, while bows and arrows, powder horns and shot pouches, historic guns and saddle bags are arranged artistically over the old-fashioned fireplace and inviting couches. Bear, moose, deer, caribou, coon and fox rugs are spread out on the floor. Deer feet and antlers are used as gun and hat racks.

It is something that would make a sportsman's eyes sparkle if he could see this rustic camp, seemingly in the heart of the Maine woods. MAINESPRING.

Sea and River Fishing.

AN ARKANSAS CENTER.

DALLAS, Polk County, Ark., May 27.—Failing health having forced a vacation, I came here by an overland trip of ninety miles from Mansfield, the nearest railway point, ascending and descending mountains and crossing valleys at heads of river systems, over roads that would have discouraged a well man; but as I had received letters from friends, full of the glories and game qualities of the golden trout, white trout and black trout of the mountain streams here, I came on to my journey's end, lured on by the hope that I might surprise you by the covering and skeleton of a golden trout of 10 or 12 lbs. weight, as they had been described to me in letters.

Bridges were unknown on the road traveled, and as we would ford the streams of clear, cold water I would point to deep pools and say to my driver, "That pond ought to be filled with bass and croppies." But his reply always was, "It's full of trout, but there ain't no bass in this country—only white, black and golden trout."

Yesterday I went "trout" fishing with two residents of this county to an old beaver dam on Board Camp Creek, near its outlet into the Ouachita River, ten miles below this place, and while my companions were hitching the team I put my split bamboo in shape, and fastening a small-sized tin "sunfish" minnow on my line I made a cast on the surface of the water, and the cast was met by a strike, and I fastened to a perfect bass of from 2 to 3 lbs. weight. As I landed the fish one of my companions recovered from his astonishment sufficiently to say: "He's got a 4 lb. white trout the first throw with that painted thing." The fish was of the exact shape of a large-mouthed black bass, but it was almost white, with a black stripe running from its gill along each side to the tail, and it was a new fish to me; but as it was broiled over the coals for our dinner at noon, in flavor it was a genuine black bass.

As I could not get a rise for an artificial bait of any description, I put a large-sized minnow upon a No. 6-0 Carlisle hook and let it run down with the creek current at the head of the pool, and was rewarded by a strike and a catch before 15 yds. of line had run off my reel, and when I had landed my fish, which was a genuine large-mouth black bass of about 2 lbs. in weight, one of my companions said, in answer to my query of the name of the fish, "That's a genuine black mountain trout, and a mighty good one too."

We had each caught two or three "genuine black mountain trout" when I had the good fortune and surprise to catch the first "golden trout," which was of about 1½ lbs. in weight, and but for its golden color would have been a large-mouthed black bass. When first landed the fish was of a bright orange or golden color, and while a portion of its skin which I inclose herewith has greatly faded, yet it will give you an idea of the fish and enable you to classify it, which I wish you would, and also the one above described and locally known as the "white trout." After a pleasant afternoon catching "white," "black" and "golden trout," about equally in number, in abundance, we came home by moonlight.

This town of Dallas, with 350 population, is the county seat of Polk County and is situated on a plateau elevated 1,125 ft. above the sea level, guarded by the Roaring Fork Mountain and the Rich Mountains on the north, and distant ten miles, while the Cossetot Mountains bound it on the south, distant fifteen miles, with the Lind Mountains fifteen miles west in the Indian Territory. It should be the center of a sportsman's paradise, as not one-third of the level lands of the plateau are in cultivation, and the rest of the surface of the country, including the sides and tops of the mountains, is covered with a heavy forest,

abounding in gray and fox squirrels, possum, coon, deer and wild turkeys, with many black bears on the mountains. Since I have been here three bears have been killed and brought in by the huckleberry pickers.

Springs of pure cold water abound everywhere, and from this plateau send spring brooks through the mountain gaps on the north of the Poteau, Petit Jean and Fourche La Fave rivers, tributaries of the Arkansas, while on the south and southeast they flow into the Ouachita, the Cossetot, Rolling Fork and Little River, tributaries of the Red River.

All brooks are swift streams of pure, clear, cold water, abounding in rocky riffles and deep, rocky pools filled with the kinds of bass or "trout" above described—bream, perch, the catfish, etc.—and Bob White possesses the land everywhere.

A kindlier, more friendly people I never saw in my life, and Col. Robert Allen and Marion B. Allen, ranchmen near Cove, twelve miles southwest of Dallas, near Indian Territory line, have several times tried to persuade me to go down home with them for a hunt on their ranch lands leased of the Choctaw Indians. They say their cowboys report many flocks of old wild turkey gobblers, from 40 to 100 in a flock, and deer, bears and gray wolves in large numbers, in the forests of the Lind and Choctaw mountains.

The game laws of Arkansas making a close season of deer to Aug. 1 and wild turkey and quail to Sept. 1, all local hunters go over into the Choctaw Nation for deer and turkeys. Four citizens of this place returned to-day from a four days' hunt with twenty wild gobblers, seven deer and three black bears, which they divided among friends.

While this country is a great game preserve at the present time, it may not last long, and the Kansas City, Pittsburg & Gulf Railway will have its line completed from Kansas City, Mo., to this place by Sept. 1, and I most sincerely wish that some of your force could be here and take a hunt in the Choctaw Nation with Col. Bob or Marion Allen, of Cove. Both are greatly looked up to by those Indians, both speaking the Choctaw tongue.

I hope in the near future to give you an account of a bear hunt with them, as soon as my health will permit me and I feel myself strong enough; for, as Col. Bob says, "Bears are getting in good order on huckleberries and blackberries, and make mighty good eating, with golden trout on the side." I remain to you and your readers

A LOVER OF THE ROD AND GUN.

[There is no reasonable doubt that all the so-called trout of the Ouachita River Basin are black bass and the local names may refer to the two well-known kinds, large-mouthed and small-mouthed, both of which are found in the Ouachita and its tributaries. The "white trout" is unquestionably the large-mouthed bass, the black stripe being characteristic of that fish. The "golden trout," as nearly as we can decide from the piece of skin above mentioned, is the small-mouthed bass. According to the most recent publication of the U. S. Fish Commission upon the fishes of Arkansas both kinds of black bass are found in all the principal river basins of that State, with the exception of the Red River Basin, in which only the large-mouthed bass is recorded. The only trout in Arkansas waters are introduced by fishcultural operations and the rainbow is the kind chiefly furnished by the hatcheries.]

ANGLING NOTES.

State Fish in Private Waters.

It has been frequently charged in years past that fish and fish fry have been obtained from the State hatcheries—fish reared by and at the expense of the State—and planted in private waters from which the general public has been excluded. There is no question whatever that the charges were true, and I found upon investigation that in one year, not so very long ago, of 98,000 trout fry distributed in one county, 60,000, or nearly two-thirds, were planted in waters wholly private. The records fairly bristle with plants of State fish in private waters. How is the practice to be stopped?

The State Fishculturist has issued a circular, in which it is stated that no fish will be furnished by the State for waters that are private. The application blanks which must be filled out in order to obtain fish of any kind declare that the fish asked for are for public waters, and yet it is not possible, I presume, to detect every attempt to obtain State fish for private fishing waters. The Commission examines all applications carefully and obtains all possible information about doubtful waters before granting one, and under no circumstances will fish be furnished to applicants for waters closed to the public if the circumstances are known or can be discovered by inquiry. If in spite of all the precautions taken fish are obtained from the State and planted where they cannot be caught, or rather fished for, by the people of the State, there is a remedy which if applied will stop the practice most effectually. The reports of the Commission give information as to where the fish sent out are planted, the name of the stream or pond and the name of the person to whom the fish are granted. It is within the province of every one to report to the Commission if fish are obtained for public waters and then planted beyond the reach of the public. A law has been enacted during the session of the Legislature of last winter which reads in part, being Section 212 of the game law, as follows: "Provided, however, that all waters heretofore stocked by the State or which may hereafter be stocked by the State from any of the hatcheries, hatching stations, or by fish furnished at the expense of the State, shall be and remain open to the public to fish therein the same as though the private park law had never existed. But nothing herein contained shall be construed as affecting any rights now existing of persons owning lands or holding leases of private grounds, waters or parks prior to the passage of this act." Hereafter when any person applies to the State for fish of any kind a copy of this law will be sent with the application blank, and it will doubtless serve as a discourager of forming private parks and posting them after they have been stocked with fish at the expense of the taxpayers of the State.

Planting Fish Fry on Spawning Beds.

A circular issued by the Fisheries, Game and Forest Commission, giving instructions for transporting and planting young fish, says among other things: "Lake trout should be planted among boulders or rocks in mid-lake, very near to deep water, into which the young trout

soon find their way. In the absence of such shoals with locks to afford hiding places for the young trout, they may be planted on natural spawning beds, when they are known." I have been asked so many times to explain why not select the spawning grounds first as the best possible place to plant the fry that I will explain here before I have to make other individual explanations to any who may be in the dark on this subject. Various species of fishes, other than trout, know where the spawning grounds of lake trout are, and they resort there to eat spawn and fry as if they all had a formal invitation to the feast. Anyone who has looked on a lake trout spawning bed at night and witnessed the eels congregated in numbers greater than the trout will not need to be told that they are great destroyers of spawn. Perch are also destructive of fry, and rock bass aid the perch in no small degree, and it is to avoid as much as possible the congregation of predaceous fishes on and around a spawning bed that it is advised to plant the artificially reared fry elsewhere.

The 13½ lbs. Brook Trout.

I use the definite article, as I imagine there is but one 13½ lbs. brook trout; but in case there should be, I will say that I refer to a fish which, in a mouned or stuffed condition, was exhibited at the Sportsmen's Exposition in Madison Square Garden last year, with the legend on a card that it was a brook trout, and that in life it weighed 13½ lbs. I said something about this fish at the time in this column, but I do not recall exactly what I said and I do not like to search the file of FOREST AND STREAM at 1 o'clock in the morning to find out. If I expressed what I thought I probably intimated that I had my doubts about the species of the fish. Record fish have a fascination for me, and I can remember the weight of one when I cannot remember my own age. The 13½ lbs. fellow haunted me for some time after I saw it in its glass-covered case perched high up out of reach of too inquisitive eyes and hands. This year I heard of the fish again, that it was in a Twenty-third street store in New York, and one day I went there to pay my respects to it. It was still in its glass-fronted case in the show window of the store, and there was no better opportunity for a close inspection of his serene majesty than there was at Madison Square Garden. The legend informed the curious that the fish weighed the same as it did a year ago, and that it was the largest brook trout on record and was caught by a lady in Iowa. The attendant gave me all the information about the fish which he possessed, which was the same as the legend on the printed card. My thoughts must have found expression in my tongue, for the young man asked me if I thought it was not a brook trout, and I could only return an "evasive answer" by asking if he happened to know positively that it was not a lake trout. If I had had the job of painting that fish to make it the largest brook trout on record, and caught in Iowa and by a lady, I would have put the paint on so thickly that the scales would not show even in the strongest light, to make it appear so very like a lake trout and unlike a brook trout.

The scales may have been grafted on by a dermatologist as an experiment, and in this way the fish got out of its class, and the painter gave it the spots and coloring of a brook trout to please his fancy. "I'm not sayin'" that it is not a brook trout, for it would be impolite, as the fish was caught by a lady (in Iowa); but I have waited several weeks to hear from a man in the Twenty-third street store who was to send me the particulars of the capture of the fish, but his letter is one of those which never came.

Texas Tarpon.

A friend and old fishing companion residing in Houston, Texas, closes a letter to me by saying: "I have been tarpon fishing several days, and will go again this week and report results. I hung one big fellow, but as usual failed to land him. There are plenty of tarpon within twenty-five miles of our city, and you can sit from early morning until late at night and see them jumping all around you."

I do not know how to interpret that expression, "but as usual I failed to land him." I have seen this gentleman land all sorts of fish but tarpon in various waters of various States, and certainly a tarpon ought not to out-general such an angler as he has proved himself to be. Any man who has threshed a Scotch salmon river from dawn until dark with an 18 ft. salmon rod cannot lack strength, and a man who has successfully cast his flies for ouananiche in the Saguenay and brook trout in Maine should not be lacking in skill, so I am obliged to think that my friend does not hook his fish securely, and perhaps this failure causes him to lose his "aliborus," which is Norwegian for sand. I would be sorry to think so, but I can think of no other reason for his failure. I am not so much surprised that he should lose a large tarpon or several of them, but I am struck dumb when he admits it.

Lake Trout Fishing.

The lake trout fishing in Lake George this year was peculiar. May is the month that the trout are at the surface, and are caught by trolling with light tackle; but the fishing the past month was almost a flat failure as a whole, although some good catches were made on occasions. The trout were never more in evidence than on some particular days during the month, but they would rarely take a lure that was presented with hooks attached. On some still days they could be seen rolling at the surface in every direction, but it was almost useless to troll over or around them, for the troll passed unnoticed by them. If trout were seen by hundreds the whitefish were seen by thousands, and it is upon whitefish that the trout feed. This food is provided so lavishly that the trout are simply gorged with it. One fisherman tells me that after trolling with whitefish for two days without a strike, he obtained some gold shiners (bream), and thereafter he had good success, as the trout took them readily enough, after ignoring the whitefish. The planting of the big lake whitefish in the lake has provided too much food, as they have nothing to do but thrive and multiply and furnish food for trout.

A. N. CHENEY.

Game Laws in Brief.

THE Game Laws in Brief, current edition, sold everywhere, has new game and fish laws for more than thirty of the States. It covers the entire country, is carefully prepared, and gives all that shooter and anglers require. See advertisement.

FLY-FISHING

On the North Shore of Lake Superior.

[Continued from page 471.]

WHEN we arrived at Raissaines, which was about 11 o'clock that morning, we were greeted by a squad of bare-footed youngsters at the beach who only desired to satisfy their curiosity as to who we were and what we wanted. We at once struck up an acquaintance with them. One of the brigade, who appeared to be the generalissimo of the party, was a perfect picture of a rustic fisherboy. He wore his straw hat in a decidedly jaunty style, his pants were rolled up to his knees, his dark ringlets curled o'er his sunburnt neck, and as he threw some gravel into the water his flashing eyes roved over us as if he wished to make some inquiries. Anticipating him in this, I first took the rôle of interviewer and asked him if his father were one of the fishermen.

"Yes, sir," he quickly replied.

"Have you ever been out to the nets with your father?"

"Yes, sir."

"Do you intend to follow the same business?"

"Yes, sir."

"Is it hard work?"

"When it storms it is."

"Are there many brook trout here?"

"Yes, sir."

"Where?"

"Down there, and over there," indicating the places with his index finger.

"Do you fish for them?"

"Yes, sir."

"Catch any?"

"Yes, sir."

"Many?"

"Yes, sir."

"Caught any this season?"

"Yes, sir."

"Where?"

"Down there, and over there," pointing again with his finger.

"Do you think we can catch any?"

"Not with flies."

"Why not?"

"Won't bite at 'em."

"Sure?"

"Yes, sir."

"What do you use?"

"Worms and minnows."

"Have you caught all the fish here?"

"There may be one or two left."

"Here," said Ned, "you have about pumped the boy dry; let us get our things ashore and the tents up, and we can investigate and soon ascertain whether a fly is not as good and as attractive as the despised angle worm or a silver sided minnow."

"I am fearful these boys have about depleted the waters in this locality. Another instance of the devilish warfare against the trout by even the adolescent half-breeds. Every trout as long as it represents coin is here pursued until it is captured or driven away."

"Our larder has always been full."

"Yes, but what earnest work it took to fill it."

"Yes, that's the beauty of it."

"The toil of it, rather."

"You seem to like it?"

"Oh, yes; but less sparsity would be very acceptable and would give us more pleasure."

"Here, take hold of this box and stop your grumbling."

"I am grumbling about the rapacity and destructiveness of the semi-savage who will soon have the last trout."

And so the conversation continued till we had our quarters completed and dinner in course of preparation.

After we had fully satisfied our keen appetites and gave the men the same opportunity, we sailed to a little island some two miles distant and at once set to work to coax some of the *fontinalis* family to take their abode in another element. By way of a wide departure in flies as well as an experiment, I used a lady-of-the-lake for my stretcher and a golden-rod for my dropper. Ned had selected as his persuaders a scarlet-ibis for his upper fly and a professor for the lower. An east wind was prevailing when we commenced presenting our flies, and hence did not look for many responses, for no wind blows that is so unfavorable as that. We, however, worked willingly and in very choice places; but it was a long time before we had a proposition, and this came to my lady-of-the-lake, who showed her enticing treachery by piercing with her concealed rapier the scarlet lips of the affectionate and freckled *fontinalis*.

Such art of subtle deceiving gives infinite pleasure, and that exasperated trout, as he rushed off with impetuous speed, thought

"That for ways that are dark
And for tricks that are vain,"

the angler with his feathered decoys is very peculiar. But now trick for trick, doubtless thought the fettered fish, and with a dart for the ruffled surface and a leap from his element of 3 ft. or more, he feels the keen east wind fanning his gleaming sides and sees with dire dismay the unrepenting eyes of his mortal foe, and then suddenly drops back to the cool waters with a firm determination to gain his freedom—a freedom with a thousand charms; a freedom that will restore him to his noble race, to all that is dear to life. Alas, alas, for the beguiled beauty, as his boldest efforts sadly and sublimely fail; the battle, however, was fought with a desperate and gallant heroism that should have made him the cherished idol of his carmined tribe. Gently and carefully he is drawn to the boat, and then the latticed twine is slipped under him and his ebbing life quickly passes away. The victor is in glowing raptures over his graceful symmetry and his iridescent hues, and in such supreme moments it seems to him a prize as priceless as the string of pearls that beautifies the snowy neck of a new-made bride.

Ned, who in the meantime had been fishing on a small promontory on the main land adjacent to the island, on seeing my triumph shouted aloud to bring the boat over, being exceedingly anxious just then to hear his reel discoursing sweet music, and thinking I had a monopoly, was desirous of being in the "swim." He was therefore ferried over by the half-breeds, and on landing commenced climbing over the steep and sharp-edged rocks to get in position at a choice place. He finally secured

the desired location, and then the sportsman, with his snowy locks streaming in the lively breeze and his eyes all a-sparkle, commenced proffering his tempting lures. Out they would sail with a whizz, alighting on some foamy crest, and then their dance over the surface commenced.

A savage response at last came to the expectant angler, and with a gentle twist of his wrist the dashing trout is impaled, and with the velocity of a whirlwind he breaks for deeper and darker water, and there cuts many a high-handed caper that makes the rodster very anxious about the capture of the fighting fish. He is, however, equal to the occasion, which is fraught with so much alarming danger, and ere long has the battling trout *hors de combat*. Ned is highly elated with his victory, and now is anxious to return, as the sea is running high, with the "white horses" riding every wave.

As the wind was blowing over the bow, the boatmen thought it best to hug the shore and endeavor to get a lee behind some of the high hills that lined the shore. Even with that advantage it was a hard pull, for the wind every now and then dropped down from the imposing elevations and gave us a heavy sea to buffet. There, however, was much to delight the eye and fancy along the capricious course of this bold shore. It is so marvelously marked by caves and caverns and craggy headlands, which the tempestuous water and biting frost have so steadily worn, and which have also made other eccentric forms as humorously dressed as a zany in cap and bells. One striking peculiarity about this rugged range is that in many places the entire headlands have been washed entirely away and nice gravelly beaches have taken their places, thus giving it a wide and picturesque diversity. Our boatmen never could see anything pleasingly impressive in these majestic pictures of rock and sea and forest. All they most admired were harbors of safety and fine camping grounds, for the treacherous lake was to them a foe that was ever seeking to destroy. A bright sky, a soft breeze, and a camp near by proved to them more attractive than any grand scenery or embellished canvas of the same from the brush of a Rubens or a Rembrandt.

Arriving at our quarters, we were greeted by the generalissimo and his bare-footed squad, who gathered around our boat when it struck the beach as if they wished to storm it.

"What did you catch?" inquired the inquisitive leader as he peered into the boat.

"Fish," says Ned.

"What kind?"

"Trout."

"How many?"

"Two."

"That's no fishing."

"Pretty good after your bait-fishing raid."

"Well, we gets money for 'em."

"So I thought."

"Say, did you ketch 'em with these 'ere flies?" says he, looking at our lures.

"Certainly."

"You ought to see us yank out when they first bite."

"Catch many?"

"Caught ten big ones one day down yonder," pointing to a low range of rocks below us.

"What did you get for them?"

"A dollar."

This tells the true tale of depletion, and just so long as these little dusky pot-hunters and also the big ones remain on this shore, just so long will the steady warfare be kept up until not a brook trout is left. Years ago we could catch all the trout we wanted at Gros Cap and Maple islands, the former about fifteen and the latter about twenty-five miles above the "Soo." Now we have to voyage at least 150 miles to get any kind of trout fishing at all, and even that at its best is quite indifferent to what it was. It is, however, consoling to realize, as we do, that "It is not all of fishing to fish," and that "bulk and weight" count little with us.

How many of these greedy anglers ever stop to admire the luster of the rising or setting sun; the sparkling concave of the midnight sky; the mountain forest tossing and roaring to the storm, or warbling with all the melodies of a summer evening; the sweet interchange of hill and dale, shade and sunshine, grove, lawn and water which an extensive landscape on these rugged shores offers to the view. Their thoughts, however, are solely on big catches, so that when the outing ends they can return with "brag and bluster" and hope to knock out all romancers in that line. They can never sing what

"The valleys, groves, or hills, or field,
Or woods and steepy mountains yield,"

That evening after supper we sat around the camp-fire, and, as we all earnestly conversed, watched the last flush of the waning day fade, and then looking upward saw the twinkling stars set their watch in the sky and listened to the sullen beating of the waves as they rolled in from the turbulent sea. Hour after hour thus passed, and when the camp-fire was in embers and the white smoke curling through the dark branches overhead, I reminded Ned of the lateness of the night by stating that even Homer and Jupiter doze now and then. This mention of somnolence sent us all to bed and to slumber sound.

The morning came with a blustering east wind and a sea that forbade all thought of angling outside the little strip of shoreland where we were quartered and which was protected by a few islets just beyond the pier. We sat around quite awhile after breakfast trying to figure out a dividend on idleness, but the stock kept sinking lower and lower with every beat of the pounding waves that made a sad racket in the little caves and hollows just above us.

By way of relief the little band of tawny mischief makers paid us a visit and wanted to know why we were not fishing.

"Where shall we fish such galeful weather as this?"

"Right there," spoke up the bare-footed generalissimo, and then he threw a stone into the lake to indicate the particular place.

"Nothing there, I guess."

"Small brook trout, sure."

"Let's venture on it as a last resort," I suggested.

Ned being willing, we got our rods, and selecting some very small flies on a No. 10 Sproat, set in to lure the little fellows. Ned sauntered up to the pier for his base of operations, while I took the boat and Kenosh and started in to try the circumscribed limits on the outer line. Ned

caught a small one before I had left with the boat, and was so overjoyed with the infinitesimal trout that he shouted to attract my attention. This satisfied me as to the verity of the boy's statement and at least promised us some sport with the spotted Lilliputians. I was soon casting, and at the very first delivery I had a rise. I missed him and tried again, and another response came and again I missed.

"You must be wide awake to catch 'em, and pull quickly too," advised Kenosh.

The third cast was now made and then some parental trout missed one of his family, for I took this one dead on the wing. I held the baby trout up and asked Kenosh if it was really a 6-incher.

"You never catch anything less here," he significantly replied.

I would have wagered a prince's ransom, if I had it, that the tinted tomtit was not a fraction over 5 in. I, however, fully considered our adverse situation that morning and fell into Kenosh's mathematical manner of elongating inches, though I assure you I never would attempt to convince any game warden that it was 6 in., provided he had his official tape line with him.

Another shortly caught on, but this one was a full 6-incher, honest measure. To abridge matters, will simply state that I soon had a baker's dozen, the largest being about 8 in. and the smallest, according to the dusky professor of mathematics, 6 in. This number fully satisfied me, and when I reached shore Ned was there and exhibited about the same number, and strange to relate not one, according to the present edition of mathematics we were then studying, was under 6 in.

The bare-footed band, who were awaiting our return, were somewhat taken back when they saw how beautifully our lures worked, and were then anxious to barter anything for a few flies. Ned told them if they would sincerely agree to give up bait-fishing, that he would supply the entire brigade with flies.

"No, siree, I don't give up no bait-fishing," indignantly replied the generalissimo.

"You get no flies then," said Ned.

"Keep 'em then," and with offended dignity he proudly stalked away, with his little army following and chattering away in no gentle mood. We felt that they would declare war against us and might storm our tents while we were off trouting, but nothing came of it, for they were around again after dinner as if nothing unpleasant had taken place. As a truce they were given a few flies and then the pipe of peace sent forth the fragrant and soothing incense.

About 3 o'clock in the afternoon the wind lulled sufficiently to permit of our going to the island to endeavor to interest the trout family in our lures, if any of them were there. Just as we were pushing off, several of the dogs of the little fishing hamlet came sniffing around our tents in search of food.

Under such circumstances it would not do to go and leave the provisions unprotected. Ned suggested, as we were now in high feather with the little army, that we send for one of them to act as guard. Looking down toward the pier, we discovered the entire party trying to tempt trout with the flies that had been given them. They were using some forest poles, and stiff ones at that, casting. They drove the trout away instead of tempting them, for their flies dropped on the water with a most terrible splash. We watched them quite a while, so diverting was it; and then Kenosh shouted for one of them to come. The leader at once started on the double quick, and on joining us we engaged him for a silver coin of no small denomination to stand guard over our provisions till we came back.

We then left, and had anything but a pleasant trip to the little promontory just off the island—a place we always tried *en route*. Here Ned caught a 2-pounder on his red-ibis, and then we crossed over to the flinty island that had not a blade of grass, a fragment of moss, or any sign of vegetable matter. It was too much exposed to storm and frost for that, and was so broken on its surface that great care had to be taken to prevent broken limbs. I at once clambered over to a favorite spot of mine, and after a cast or two had a tigerish response and a battling trout that kept me in anxiety till Jo had him safely in the landing net.

Repeated castings here bringing no more to the surface, I crossed over the misshapen rocks to the east side of the islet—for it was nothing more—and was fortunate enough in my third cast to hang one that tried to take in my royal-coachman. He at once was savagely defiant, scorning surrender as if it meant degradation. No warrior of the deep that wears the royal robes of rainbow hue ever yields to the foe above as long as an atom of strength remains for resistance. This one was a brave fighter that strictly held me to the fierce battle. Time and again did his heroic struggles and lofty vaulting cause me much nervous anxiety, but the willowy wand and silken thread were of sterling quality, and always to the fore in a dread emergency. I twice gave him the butt, turning his retreat and baffling him so completely that he lost his head and in consequence the fight. The capture of this prize was a little world of pleasure to me, and fully repaid me for the entire afternoon's outing. Of the glowing beauty and lovely lines and curves of grace which this trout displayed no pen could describe, no artist dream into canvas.

We caught one more trout and then, as night was fast approaching, discontinued our casting, and embarking on the boat were soon at our quarters. We found the generalissimo on guard with his bare-footed brigade around, as also three big sledging dogs. The boys were all munching some of our crackers, to which they had helped themselves, and by way of their accounting for the little freebooting said they were "awful hungry," and were willing to pay for what they had eaten. With the silver coin the captain general had received he felt able to liquidate all such claims, but Ned told them it was all right and to take some more if they wanted them, which they did without waiting for a second invitation. Having loaded up with crackers, they started off as happy as a spring lark when he prunes himself in the sunshine.

After supper the evening developed a picture of perfect despair. No twinkling stars, no silver moon, nothing but the moan of the billowy sea and the wail of the weeping forest. We all felt its depressing effects, and to mitigate it the half-breeds made a rousing fire and stirred up a golden rain of sparks that made a little lurid world of our own. We then planned to leave in the morning for Aguawa Harbor, provided the weather was favorable. Kenosh made no prognostications about it, as his bones

were not aching and therefore his anatomical barometer was giving out no indications.

Ned wisely suggested going to bed and sleeping over it and taking it in the morning, as one takes a wife, for better or for worse, and no kicking about it either. It was wholesome advice, and we therefore cheerfully abided by it.

The angler's misery, the festive mosquitoes, we discovered after retiring, were out in great clouds and we could distinctly hear their direful war songs as brigade after brigade of them charged into our tent with their little daggers drawn. In addition to this annoyance some roving cattle, rendered furious by the attacks of these winged warriors, were wildly tramping around our tent all night, and in such close proximity that I had to get up and fasten the folds in front to prevent their entering as a refuge from their tormentors. As if our troublesome company was not fully sufficient, several ground squirrels put in an appearance and selected the roof of our tent for their mischievous frolics, while a number of field mice seeking for snug quarters crawled under our blankets for a serene *siesta*. It was everything but a quiet night, but amidst all the disturbance we finally fell asleep.

ALEX. STARBUCK.

[TO BE CONTINUED.]

NATURAL FOOD FOR TROUT FRY.

BY FRED. MATHER.

[Read before the American Fisheries Society.]

HALF a dozen years ago, more or less, a fishculturist in Europe published an account of his experiments in rearing trout fry on natural food, which he had learned to produce in great quantities by a process which he would not divulge. His system included a supply pond where the living food was bred and a series of small pools which served as temporary pastures for the fry until the food in one was exhausted, when they were to be driven into another pond, as cattle are changed from one pasture to another. This man's article was translated into many languages and was published either in the annual Report of the U. S. Fish Commission or in its Bulletin. At present, while writing this article, my library is packed away and it is not possible for me to quote the volume nor to give the name of the gentleman who originated the idea, but I have stated his main plan and remember that the secret process of growing live food was offered for sale to me, as no doubt it was to other fishculturists, but for two reasons I paid no attention to the matter; one was that I never cared to buy any secret, and the other that the plan seemed to be impractical on any scale such as we use in America. The plan of driving small trout from a grassy or weedy pond condemned the whole thing because they do not drive well, and in such a pond many would remain and keep down the expected increase of food, and so the wonderful scheme was dismissed from serious consideration.

A while after the first announcement of this discovery of how to rear trout without expense, it leaked out that the process was to use the dung of animals in water to grow diatoms by the million, and the diatoms in turn would furnish food in plenty for the smaller crustaceans, as daphne, cyclops, gammarus and perhaps other forms of life on which young trout thrive in a state of nature. This was perfect in theory, but I still was skeptical as to its value in practice, and the scheme passed from memory until it was brought before this society two or three years ago and lightly discussed. You may remember that Mr. Frank N. Clark said that he had experimented a little in this direction with several forms of ordure, but had produced no results that were satisfactory to him. Last summer I had leisure to try this scheme, and will give the result of the experiments.

There was a dripping fountain in my yard supplied from springs in the hill above, which also supplied a portion of the water used in the State hatchery, on lower ground. This fountain was supplied by a $\frac{3}{4}$ in. lead pipe, and the water trickled and dropped over rockwork into a basin, and from there the overflow went through a series of small pools in my garden, where the year before several species of wild ducks had been confined. An examination of the water in the first pool, and also in the small open pond above which caught the flow of the several springs, revealed the fact that it contained the forms of minute life named above as well as rotifers, hydra, snails and several kinds of water insects as well as their larvæ. Therefore all the conditions seemed favorable.

For the benefit of those who have paid no attention to the minute forms of life which it was proposed to breed it may be well to say that diatoms are invisible to the unassisted eye except when in mass, as we often see in swamps, where they appear as an iridescent scum on the surface of the water in still places or in the spoor of some heavy animal. They were formerly supposed to belong in the animal kingdom, but are now classed among the lower forms of algae and have a shell or case of silica, which passes undigested through fish and turtles. These diatoms form the principal food of the oyster, and naturalists have recorded and named something like 4,000 species of them, but we will not go into the subject so deeply. Suffice it to say that the microscopical vegetables can swim in most cases and supply food for animals also microscopic in their young stages, such as the daphnia, cyclops and other forms of entomostraca, which in turn feed young fishes.

To be complete such experiments should begin in February, when the earliest trout of the year may begin feeding; but these experiments began in April, in time, however, for the production of food for the later hatch to get their first meal. The water now on Long Island was a trifle warmer and presumably more favorable to the production of such life as was desired. The temperature of the water during the season was as follows, mean temperatures only for each month being given in scale of Fahrenheit:

	Rockery.	1st Pool.	2d Pool.	3d Pool.	4th Pool.
April.....	55.5	55.10	59	59.75	60
May.....	58.5	60	61.25	62	62.10
June.....	62.75	64.10	65	65.75	66.25
July.....	69.25	73.25	75.10	76	78
August.....	72.75	74.5	76.25	76.75	77.50

With August the record ended. Neither time nor inclination allowed further observations, for the season had covered the production of food during the most critical period of the life of a baby trout.

The "Rockery" received the first water from the spring pond, already mentioned, and in the basin at its top was

placed both old and fresh cow ordure weekly. In the first pool there was a division of the water, and in one-half horse dung was frequently put, both fresh and stale, and in all the pools was a deposit of duck dung of the previous year, well dissolved, and stocked with all the forms of life which was thought desirable to cultivate. At different times water was taken from each of the five places in this way: One gallon from the surface by immersing the measure, one gallon from the middle, and one from the bottom by means of tubes, and the contents filtered through No. 8 wire cloth, cheese cloth, and then through the finest of mill silk bolting cloth. The last would retain almost all but the smaller diatoms, and they were caught in a funnel of filtering paper below all the other strainers.

This work, being done twice each month for the five months including April and August, should give a fair average of the amount of food in the pools during the season in which the operations were conducted. The following gives the amount of entomostraca obtained, and excluding snails and the diatoms. In other words, the amount of food available for trout fry in their first season, such as they can see, seize, swallow and assimilate. The pools contained about 150 cubic feet of water, or 1,125 gallons, of which 15 gallons, or $\frac{1}{75}$, were strained on ten different days, at the 1st and 15th of each month.

Of the above-named food 2.25 grams were caught, equaling .225 grams per day. This multiplied by 75 gives us 16.875 grams for the entire water per day, and again multiplied by the 153 days gives a total of 2,581.875 grams in the whole season. Dividing this by 24 gives us 107.578oz., a trifle less than 6 $\frac{1}{2}$ lbs. avoirdupois.

We must consider the fact that no fish were feeding in these pools, and that the calculation is made as if the animals lived only one day and were replaced by others. This is not the fact, and how long they may live I cannot say, but if each individual lived a week the amount of food produced would be less than 1lb. in the entire season, as the calculation is for a daily renewal of all life. Two hundred baby trout could have lived there during the first week of their lives and fed well; after that time, when their appetites began to get sharper, say in a fortnight, all the food to be found would be just what came in the water supply, and that would not have fed half a dozen when two months old. If I had been skeptical of the practical utility of this scheme before this experiment there has been nothing to convince me of error; still, if other trials under other circumstances show that it is practicable to raise enough natural food to rear 20,000, or even 10,000, to be six months old, I must try the plan which has proved to be successful. While writing this I do not know that any other men but Mr. Clark and myself have worked in this field in America, still it is to be hoped that they have done so, and that they will publish their experience. Such work is very interesting to one who has a taste for it, as most fishculturists have, and this paper may stimulate others to similar trials. I think one plan was to have a number of separate ponds in which to breed the food and to tap them in succession, and allow each one to furnish food to the fish, which were not to be driven to the pasture, but to remain in one pond and get the food supply from different sources at different times. This is certainly the best plan, as any trout breeder will certify, because it is a difficult matter to get the last dozen trout from a pool containing vegetation or hiding places of any kind. At present writing I have less faith in the scheme than when I began to experiment with it.

CHICAGO AND THE WEST.

A New Chicago Bass Country.

CHICAGO, Ill., June 6.—I mentioned last week that a friend and myself had discovered a lake down in Indiana, where we intended to catch about 450 bass. We made the trip, but owing to a newly discovered clause in the Indiana fish laws—as see the "Game Laws in Brief"—by which, since 1895, it has been unlawful to take any fish from Indiana lakes for any other purpose but that of stocking other waters, we did not catch the 450 bass, which we will get some other time. But the trip resulted in the discovery of about 450 lakes and streams full of bass which I had no idea lay so close to Chicago, whose vicinity I fondly dreamed I had pretty fairly explored. Indeed, though we got no fishing, I got almost more news than I knew what to do with, and returned very much surprised at the extent of fishing country there is lying at the door of Chicago, to which, so far as I can learn, the Chicago anglers rarely go. Moreover it is a strange and interesting country, and well worth careful study. For instance, so far from its being a low and marshy country, it is one of swift and cold streams; and so far from being occupied only by bass and pickerel as fish life, it also carries trout. I venture the assertion that FOREST AND STREAM is the first newspaper to discover the fact that there are trout in Indiana, as it was the first to publish the fact that there are trout within eighty miles north of Chicago.

Our newly discovered country lies within sixty-five to eighty miles from Chicago, to the southeast, just at that point below the foot of Lake Michigan where all the East-bound railway trains make their turn around the lake and start for the East. I came pretty near discovering this country four years ago, when Alex. Loyd and I made our expedition to explore the headwaters of the Calumet River and discover its source—something which at that time had never been properly done. As readers of FOREST AND STREAM probably do not remember, we followed the Calumet far up through the marsh region which lies outside the sandhills that hedge the lower end of Lake Michigan to a point near Chesterton, just above the mouth of Salt Creek. Here we broke an oar and were compelled to abandon the expedition, this being the proper finishing touch to most great expeditions, which come back with explanations and leave the results behind. On this last occasion I actually got the results, and am prepared to say that I have found the head of the Calumet River—its very head, the utmost and ultimate spring from which it begins to flow. A great many men have found the headwaters of the Nile, but does history say anything about anybody having found the headwaters of the Calumet? I opine not. And I opine further that even to-day there are very few Chicago sportsmen who can guess within thirty miles of where the head of the Calumet really is. Most of them would believe it rose in some marshy spring hole barely above the level of the Tolleston marsh. I was surprised to learn

how far from true this is, and surprised to learn also how close upon the trail of the Calumet Mr. Loyd and I were on that fateful evening when, just at dusk, we broke an oar and had to seek shelter at a light gleaming dimly across the wide and desolate marsh. At that point we heard of an old mill pond up Salt Creek where once upon a time the bass were of enormous size, but which was partly drained twenty years ago. We heard vaguely also of another pond, nearly up to that mysterious town known in Chicago as Valparaiso, but universally in Indiana called "Valpo." At a time subsequent to that voyage of discovery my friend Harryman and myself went fishing in Salt Creek, and found it held fine bass and excellent croppies. We did not then know how near we were to this country of which I am now writing, but we shall presently see that we were treading upon the very heel thereof. On this recent trip I heard fluently discussed these very points to which on the earlier trips I had attained, and found that some of them were not more than ten or twenty miles from the spot where I then actually stood. Then I was very proud that fortune had brought what zeal had sought, and that not to some one else, but to FOREST AND STREAM belonged the glory of having set at rest the gravest of preëxisting doubts, and of having discovered the actual head of the Calumet. Not only both these vaguely known ponds have been definitely located, but others, half a dozen of them, have been discovered. There shall appear to the anglers of Chicago an opportunity for bass fishing in a new sort of water—to wit, the mill pond, which hath in all time been held excellent.

On this late trip Mr. Phillips and I went to Haskells, on the Chicago & Grand Trunk Railway, at the point where it crosses the Monon line. Thence we walked four miles, which we discovered it took just fifty-seven minutes to do with one's kit on his back—this fact being stated for the benefit of those who wish to know about the schedule. At the end of the four miles we arrived at the village of Westville, a pretty little place of a few hundred inhabitants, and here we were received with the most cordial hospitality by Mr. and Mrs. E. Ansley, who certainly treated us better than any two hungry fishermen ever deserved. Here we lived as royal personages for the time of our stay, with horses and carriages at our disposal for the exploration of the land whenever it suited us to cease loafing and visiting. It was out of this visit, made without any geographical plans in view at all, that there arose the chance discovery of the head of the Calumet and also of a vast and unexplored region of great sporting interest, which, though occupied for some generations by settlers, has never until this date been properly discovered and charted. It chances that Rob Ansley is the county surveyor for that county, and in his work of running the ditches of the drainage work along the Kankakee and other streams of that region has become very familiar with the topography of the country. Moreover, I became acquainted, of course, with Dr. B. W. Hollenbeck, a friend of the family, and an enthusiastic angler, who has fished in every lake and stream within fifty miles of Westville. Thus alike the material of discovery and the means thereto lay fairly at hand, thanks to the FOREST AND STREAM luck. The rest was simply matter of detail, as will appear hereinafter.

On the first evening of my stay at Westville I rode out with Charlie Ansley to the little lake where Mr. Phillips and I intended to do our fishing. We found it a pretty sheet of water of about a quarter of a mile in diameter, round as a dollar and very clear. It had no inlet or outlet, and was commonly reputed to be fed by springs. Originally there were no fish at all in this little lake, but about twelve years ago a local angler began to put into it the bass and sunfish he was catching in other waters near by, and before long the fishing became very good. The bass from this lake are very bright and clean-run looking fish, and Mr. Phillips, who had great sport here last year with the fly, says they are as gamy as any he ever took. At the time of our visit the caddis fly was just beginning to come up, so that we knew there would be fine fly-fishing in a week or so. This lake has a great local reputation, but not all who go there are able to take a good basket of fish, for the bass, though of the big-mouth variety, are as capricious as small-mouths. I should not call this a good frog water, but better for minnows, from all I could learn. There is no feeding ground of any definition and all the shore seemed much alike.

Schools of Black Bass.

The bass here have a peculiar habit, which I have never heard of their having in any other water, and this I had full opportunity of seeing illustrated. I was standing on the bluff above the lake when I saw a commotion in the water and thought a heavy bass was rising there. I spoke to Charlie about it, but he said, "No, that's a school."

"A school of what?" I asked him, and he replied that they were black bass. This I did not believe, but told him they must be croppies or perch, which often travel thus in large schools at the surface of the water, just as these fish could now be seen doing. He insisted that they were black bass and later I learned absolutely that this was the case. We saw at times as many as three of these schools playing at once. They came on, leaping half out of the water, or with their backs half out of the water, making a constant bubbling commotion on the surface of the water like a school of small porpoises, one after another rolling up and then down. This always was in water apparently as deep as any in the lake, from 20 to 40ft., and the schools would work around on a space of not more than a few acres in extent, disappearing for perhaps half an hour at a time.

I could never determine what they were doing in these schools, nor did I ever find anyone who could tell. Of course I have seen bass feeding in schools, but this was usually in shallow water and not then always on the surface. If these bass were feeding it was impossible to tell what they were pursuing. Certainly it was not minnows, for the fish were not in action enough for that and were not scattered and plunging, but in a regular and solid body and not over shallow water at all. One would believe they were feeding on caddis, but the day was cold and no flies were coming up, and one would not look for the flies over the deep water. Moreover, we were within 10ft. of the school once or twice, and I can say that no fly was on the water. I have seen trout acting this way and never knew them to bite then, but the trout played higher in the air. I can describe the action in no way better than by comparing it to the play of a school of porpoises.

Yet there was this difference, these bass would take food, at least would strike at anything thrown among them. Mr. Phillips told me that he had his best fly-fishing last summer by following up these schools and casting the fly over them. They would strike it as soon as it landed among them, but it was difficult to get near without alarming them, at which they would at once sink, rising again perhaps 200yds. away in a few minutes. I asked Mr. Phillips if he always took black bass in this casting and never croppies or perch, and he said it was always black bass. He said that a bait of any kind was struck in the same way, usually as it sank lower down into the water, sometimes 10ft. below the surface, the fish appearing to follow it down, or to strike it as it followed them down. Whether they struck in hunger, in sport or in anger we could never tell; but certain it is that the bass of this lake will strike when thus playing in schools if one be able to get near enough to place the bait fairly among them. Some fishermen were on the lake while we were there, and these told us that the fish we saw were "silver bass" (croppies). This idea was opposed by Mr. Phillips, who proposed to go out and get close to a school to see about it. We were lucky enough on two occasions to have the schools rise almost under the boat, once coming head on to us at a distance of only a few yards and sinking not more than 10ft. from us, as we were perfectly still at the time. I saw the fish plainly, and know they were black bass. It may be that black bass do this in other localities, but it was a new habit for them in my experience, and a very curious and inexplicable one. I should say that the food supply in this little lake was limited, and though there are a few large bass taken there each season, they are not very common. All the bass in the schools seemed of the same size, probably 2-year-olds, and of about a pound weight. The weather was very cold and lowering at that time, but those living near the lake said the weather made no difference in this schooling up of the fish, and that they seemed to do it all summer long. We saw no schools except over very deep water, and though at times the bass of this lake go out into the lily pads and rushes in the evening in search of something to eat, as all well-regulated big-mouth bass should do, we saw not a rise in the edge of the lake that day. There were some old spawning beds in parts of the lake, but local observers said the bass in this cold lake had not yet spawned.

I accepted the common belief that this lake was a spring-fed water until I met Dr. Hollenbeck, who told me that it was not so at all, but that it was just a cone-like hole down in the ground, which had always had water in it. Yet since the settlement of that country the lake has shrunk nearly a third in size and has lost from 5 to 10ft. in depth, this possibly being some mysterious result from the draining of the country about, which in places was low and marshy.

Mystery and History.

Westville lies in the heart of a weird and mysterious region. Once upon a time, and this was not so very long ago, there was a regular gang of horse thieves who operated in Indiana and Illinois, and had their headquarters on an island in the great upper marsh of the Kankakee. To this island they are reputed to have retreated by boat, running through ill-known channels into which the officers never tried to pursue them. A criminal once in the marsh of this region was safe, and it is of record that in some of the train robberies which occurred three years ago the robbers were traced to points in northern Indiana near the wild marsh region, where they seemed swallowed up by the earth. A native of that country will go where others dare not go on the bog, and no mountain fastness was ever more secure than these of the marshes before the big ditches were cut through. It is of record that a gang of counterfeiterers was a few years ago traced to such a spot in the river wilderness along the Kankakee, and they were found to have a complete plant and central headquarters there. The draining of the marshes may bring to light other strange things. Already two mastodon skeletons have been discovered in the marsh near Westville. It is well known that the entire marsh for miles near there is full of a fine quality of bog iron. We saw places where the earth was red for great distances with the iron, which discolors the soil like red paint, and lies upon the surface for acres. What there is below the Kankakee marsh no one knows. Its bottom has never been found. In one of its lakes, known as Mud Lake, the mud is so soft that it will carry up almost no weight at all and is practically bottomless. The water is shallow over most of this mud, and this fact makes the place a veritable man trap. Swimmers think the water shallow enough to be waded, and perhaps attempt to cross a part of it in this way. If once they get fairly into the soft mud, their fate is sealed. Dozens of boys and men have perished miserably in this lake, and of the lost ones not even one body has ever been recovered. The mysterious marsh has never told its secrets.

Westville may thus be seen to have features of interest. Moreover it is in a way famous, having produced one or two celebrities in its time. Mr. and Mrs. Ansley, for instance, occupy the house which was owned by the family of Loie Fuller, the dancer, who attained such vogue in Paris and returned to this country with the name "La Loie." In this little village La Loie was brought up—well, I won't say how many years ago. You can still, even at this day, see there the footprints made by La Loie (in the ceiling) at the house we lived in while we were discovering the Calumet. In fact, as I said, while we did not get fish, we got all sorts of discoveries, from mastodons, danseuses and horse thieves to glacial epochs, terminal moraines, bog iron, bass lakes and mill ponds, of which more at another time.

Waterford Bass.

Mr. C. Grundseth, of Waterford, Wis., is good enough to write in regard to some fine fishing in the Fox River near his place. Waterford is seven miles from Burlington, which point is on the Wisconsin Central road. Mr. Grundseth says that the river at Waterford is very deep above the dam, averaging 10ft. for a stretch of five miles. This makes good fishing for large and small-mouth bass, pickerel, pike, and occasionally muscallonge. The fish in this part of the river grow very large, but it seems that the pernicious practice of ice-fishing is carried on. One pickerel was caught last winter which weighed 32lbs., and Mr. Grundseth says he has often caught them weighing 19, 15 and 13lbs., and many over 10lbs. One

black bass was caught last winter which weighed 7½lbs. Mr. Grundseth kindly asks me to come up and investigate some of these big fish, and it would be a pleasure to do so some day.

The Chicago Clam Preserve.

Hon. A. Nelson Cheney, State Fishcultivist of New York, has written me for the benefit of Constant Reader, who recently made some inquiries about starting a clam preserve in or near Chicago. Mr. Cheney states that since making his scientific reply to the queries aforesaid he has discovered the following information in regard to large clams, which, in the form of a clipping from a periodical, he incloses to me. It reads as follows:

Men have stepped into the open jaws of huge clams accidentally at low tide, and the clams, closing their jaws, have held them fast till the tide rose, when the men were drowned. Other men have reached for a lure in the form of a luminous spot. The instant they touched it the shells of a clam closed on their arms and in a few minutes the men were drowned. Some of the clams that trap men are found embedded in the coral reefs of the Pacific and Indian oceans, and the men captured are pearl divers. The flesh of one of the huge clams sometimes weighs 20lbs., and added to that is the 500lbs. or more of shell. The shell is something like 5ft. long by 2½ft. wide. Poets are fond of saying that these shells are the cradles of sea goddesses, since they are very beautiful if polished. They are also used as baptismal fonts.

I am afraid that Constant Reader may be a trifle shocked and apprehensive when he reads the above and considers the dangers which may arise from the industry which he proposes to inaugurate. Still, I am satisfied that local pride will cause him to unite with me in the belief that we want nothing but the biggest kind of clams on earth for the Chicago clam preserve. I trust that eventually we shall elicit much information in regard to this interesting question. But I do not believe any sea goddess will ever come out of a clam here in Chicago. The climate is not right for that.

Mr. T. H. Glover is a very good friend of mine, whom I have never seen and who lives way down in Texas. He reads all the current literature and all the magazines, even down to the little modern vest-pocket magazines that you can buy three for a cent. In one of the latter publications he has found something by the pen of Ouida, of which he makes inclosure to me. One naturally associates the name of Ouida with tall guardmen with long, tawny moustaches and more or less indifferent morals, but it seems that Ouida can occasionally take a fall out of hard cold facts as well as anybody and show a level-headedness worthy of a better fate than hers. In the extract which my Texas friend admires Ouida has written something about "Gold that Glitters," and I am sure that her words will jump well with the inclinations of many a man who is in the city and wants to get out in the wider, open air. The words are a sermon too, and one well worth laying to heart. She says:

When all green places have been destroyed in the builder's lust of gain; when all the lands are but mountains of bricks and piles of wood and iron; when there is no moisture anywhere and no rain ever falls; when the sky is a vault of smoke and all the rivers reek with poison; when forest and stream, the moor and meadow and all the old green wayside beauty are things vanished and forgotten; when every gentle, timid thing of brake and bush, of air and water, has been killed because it robbed them of a berry or a fruit; when the earth is one vast city, whose young children behold neither the green of the field nor the blue of the sky, and hear no song but the hiss of the steam, and know no music but the roar of the furnace; when the old sweet silence of the country side, and the old sweet sounds of waking birds, and the old sweet fall of summer showers, and the grace of a hedge-row bough, and the glow of the purple heather, and the note of the cuckoo and cushat, and the freedom of waste and of woodland are all things dead and remembered of no man; then the world, like the Eastern king, will perish miserably of famine and of drought, with gold in its stiffened hands, and gold in its withered lips and gold everywhere; gold that the people can neither eat nor drink, gold that cares nothing for them, but mocks them horribly; gold for which their fathers sold peace and health, and holiness and beauty; gold that is one vast grave.

Yet there are those who still want more gold. They realize not that they will be playing in hard luck if they make all the money in the world and still can't eat and digest a good beefsteak. For my part, it gives me a shiver to think of that, and I think I shall stop counting my gold and go fishing in self-defense. Behold, on the meadows lieth the hay and the sun shineth well to-day. Why sit we here idly working?

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

THE LAKE CRESCENT TROUT.

PROF. JORDAN having decided that the two specimens of trout sent him from Lake Crescent, termed locally a blue-back and a speckled, were to him new and as yet undescribed, and having named them, the one *Crescentis* and the other *Beardsleii*, we who are interested in the matter are naturally doing our best to bring to his notice and inspection at as early a date as possible specimens of the other varieties of trout found in that prolific lake and unknown to me, viz., the mountain trout, silver trout and half-breed, which I have seen and caught, together with such others as may be there. Therefore by proxy, for I am unfortunately so situated that I cannot act in person, I am endeavoring to supply the demand.

From a letter just received from Mr. Carrigan, my co-worker in my Lake Crescent trip, I learn that on April 17 I was reduced from my position of high hook, for on that day Mrs. Michell, fishing with the gear I had devised and left with her, succeeded in taking a blue-back whose length was 30in., depth 8½in., weight 12lbs., thus breaking my record, for my largest scored but 11½lbs. So I surrender the champion belt, only too pleased that it falls into the hands of so charming and worthy a successor.

On the afternoon of that day Mrs. Carrigan and Miss Beazley, of Missouri, having driven out to Lake Crescent to visit Mrs. Michell, enthused by the sight of the big trout, and prompted by ambition and the desire to send specimens to President Jordan, went fishing also. Mr. Carrigan writes: "Mrs. Michell managed the boat; Mrs. Carrigan and Miss Beazley fished. They returned in triumph with four trout weighing 21lbs. Yesterday forenoon (18th) they went out again and returned with a fine lot of fish, among which were one blue-back, 10lbs., 29½in. long; another of 11lb., a speckled trout of 8lbs., 27in., and another of 2lbs."

The big blue-back differed from those caught by me last October only in that it proved game and a strong fighter until landed, and made several strong rushes and leaps before it was brought to the boat. Mine caught in October did all their fighting while deep down.

The speckled trout of 8lbs. beat my largest badly, mine was but 2½lbs.; and the largest I saw was 4½lbs. But the most valuable of the catch was the young blue-back, for there was a remarkable difference in its coloration and that of those I took in October, or the 10-pounder taken

by the ladies, thus described, "Midway between the medium line and the bottom of the belly there extended from just behind the gills to the tail a line of dark round spots, decreasing in diameter from ½in. at the gills to less than ¼in. at the tail; these spots are not distinctly black, but resemble the dark dull appearance produced on human flesh by a blow or bruise; they show plainly through the silvery white scales, and there are on each side seventeen."

This is part of what Prof. Jordan says of the specimens which Mrs. Michell sent to him from Lake Crescent: "Recently one specimen of the rainbow and two of the blue-back found in Lake Crescent have been sent to me for examination. I find, myself forced to agree with Admiral Beardslee in the opinion that each of these forms is distinct from any previously recorded or named. The two are allied to each other rather than to any other form, and the nearest affinities of both seem to be with the steelhead trout (*Salmo gairdneri*) rather than any other. But to place the two as subspecies of *Salmo gairdneri* is simply a provisional arrangement, and there is just as good warrant in regarding each as a distinct species. From all forms of *gairdneri* both the new forms differ in the large size of the head, in the form of the head and opercles and in coloration, the size of the scales, form of the gill rakers, form of the opercles, form of the pyloric coeca, and outline of caudal."

Taking into consideration the unprecedented earliness of the blue-back catch this year, on March 12, and the unusually good fishing in April, as indicated by the facts in this letter, I think it safe to strongly indorse my statements in previous letters, that the spring fishing at Lake Crescent must be magnificent, for there I am told the big fish will take large salmon flies or brown hackles, and I will again give my prophecy that the lake will, before this season is over, contribute again two at least and I think more additions to the listed *Salmonidae*.

May 10.—I inclose a letter just received from Mr. Carrigan, which indicates that Lake Crescent is proving a veritable bonanza in the way of big and new trout:

"PORT ANGELES, May 5, 1896.—I have just forwarded to Prof. Jordan a magnificent blue-back (*S. Crescentis*, Jordan) weighing 14lbs. and measuring 32in. by 8½in. Ben Lewis caught it Sunday afternoon late and at once started for Port Angeles to turn it over to me. He rowed the lake eight miles, and footed it into Angeles twenty miles more, carrying the trout in his pack and arriving at midnight. I have to-day packed and sent it to the professor, for I want him to see a grown-up specimen.

"Ben says that a great number of very large trout are jumping just before dark every pleasant evening; and he told me about another entirely new variety that he takes in the lake at a depth of from 80 to 100ft, with set lines placed out over night. He has never known of one taken by any other method. He says they are different from any other trout in the lake. They run in weight from 3 to 4lbs.; are long and slender, and have grayish-green backs, and below the median line the sides and belly are gleaming white."

The people on the lake are now in shape to take care of fishermen who don't want too much luxury, and to give them a good time. I only wish I could join in the amusement, as I heartily commend the trip to any one who can afford the time and cost. Now is his opportunity to get a trout named after him.

PISECO.

This Salmon Took the Fly Twice within Fifteen Minutes.

RESTIGOUCHE RIVER, Chamberlain Shoals, June 10.—*Editor Forest and Stream:* Not a great many years ago it was claimed that a salmon never took a fly the second time within two or three days. It has, however, been proved during the last few years beyond doubt that salmon have taken the fly the day following their being hooked and lost. So far as I know, however, the following circumstance is unique:

On the 5th of the present month I was fishing at Jordan's Portage Pool, on the Restigouche River, when I hooked a salmon on a new double dusty-miller fly. The fish was what is generally known to fishermen as a "jigger," and in about ten minutes broke my casting line. I put on a new casting line and the same kind of fly. This occupied something less than fifteen minutes, including moving back to my old position. On the third cast I hooked a fish, also a very lively "jigger," which took me about half an hour in killing and weighed 25lbs. Judge of my surprise on finding in my captive's mouth the remains of the casting line and fly which I had just lost. There can be doubt of this being the same fish. The pool had been fished the previous day, for the first time this season, by one of my party, and he had not lost either casting line or fly. There had up to that date only been three or four persons fishing below me, and none had met an accident similar to mine. The second fly in the salmon's mouth was a new double dusty-miller, and the recaptured casting line when added to what had remained on my line made it complete. Additional evidence is the fact that my casting line broke at a knot, and when both that which had been lost and that which remained were placed together the cast was complete, and the distance between the knots at point of fracture was the same as between the other knots. This fish therefore took the fly twice within fifteen minutes. There cannot be any doubt of this fact.

FRANCIS W. CAMPBELL.

The Canadian Salmon Season.

DEE SIDE, Metapedia, Quebec, June 11.—Since I wrote you last week there has been splendid fishing. The water holds good and all anglers find good fishing. From two to six fish a day are secured, and they run a very large average, from 19lbs. to 36lbs. One of the tidal nets had a 44 and a 45lb. one morning. When I tell you that 7 cents per pound is now paid instead of the usual 15 cents, you may understand that the commercial catch is wonderful. I am told at Gaspé you can buy at 4½ cents and 5 cents per pound. Many anglers are on their grounds, and the express generally has from thirty to forty boxes of anglers' fish to carry. You can thus form an idea of the quantity caught. Every day loaded canoes pass down with fish to the station. My own score is only ten bright-fish yet.

The kelts are all gone to sea; fish are in very fine condition; many break away and it is not uncommon for a fish to take you from one to one and one-half miles down river before you can land him, if at all, as the current is

very strong, and when he takes the notion and gets going in the strong water you must go with him, in fact to get ahead of him is the only way you can land him.

Mr. Mitchell, of Norwich, had ten fish last week and I heard he added ten to his score in three days of this week. I gave him fifty for a total score, with which I know he will be satisfied and he will get them, I hope. Some new blood is on the river. Mr. Ayer, of Bangor, Dr. Jarvis, of Hartford, are well up river. Mott, Holbrook and Ried, of New York, are doing well on the Dawson water; a new party is also on the Metapedia River, up which runs the I. C. R. You may safely put this season down as the red-lettered one for angling on the Restigouche.

JOHN MOWAT.

Lake Champlain Fishing.

ROUSE'S POINT, N. Y., June 11.—*Editor Forest and Stream:* The largest fish that, to my knowledge, was ever taken with line and hook from this end of Lake Champlain was captured a few days ago by James Brennan, while fishing for bullheads from a boat tied to the C. V. R. R. bridge.

Mr. Brennan had made a good catch of bullheads, and was cleaning them before starting for home. He had one line in the water while dressing his fish, and this line began to run out at a rate that quite frightened him. He thought at first that he had hooked the great Lake Champlain sea serpent; but after one hour's hard work he managed to kill his fish, which proved to be a rock sturgeon weighing 33lbs.

I have the fish mounted, and will be pleased to show it to any of the great family of FOREST AND STREAM readers that may happen this way during the summer.

The bass and pike fishing here at present is very good. Good strings of pike are being brought in every day; but I am sorry to say most of the bass were taken out of season.

W. McCOMB, JR.

Loon Lake in Maine.

LOON LAKE, Rangeley, Maine.—Mr. E. A. Fanwell returned home Wednesday. He had great sport fishing at Loon Lake; in one hour he caught twenty-five trout, the largest weighing 2½lbs. (a very handsome trout), and he is having it mounted. Mr. H. H. Bates while at Loon Lake caught over 200 trout and saw seven deer in the lake at one time. Mr. George York is having fine success fishing, in half an hour he caught fifteen, largest 1½lbs. Fishing never was better. This is a fine place to spend your vacation; each person or family can have a camp by themselves and all the comforts of camp life.

R. S. YORK.

Cayuga Lake Sturgeon and Muscallonge.

ITHACA, N. Y., June 13.—A sturgeon weighing 32lbs. was caught on the 11th inst. in the Ithaca Inlet. This is the heaviest fish taken from local waters in recent years. At Union Springs, one day recently, a 16lb. muscallonge was taken by a native from the wilds of Auburn, N. Y.

M. CHILL.

Game and Fish Protection.

FISH AND GAME PROTECTION IN NEW JERSEY.

BY H. P. FROTHINGHAM.

[Read before the American Fisheries Society.]

I HAVE been asked to present to you my views on the progress made in the protection of fish and game in the State of New Jersey, and I shall do so in as brief and still comprehensive a manner as possible. It would be useless for me to say anything to you, gentlemen, on the necessity of such protection, and consequently I shall at once proceed to give you my views as to why fish and game are not better protected in New Jersey; and I feel confident that a great deal of what I shall say pertaining to New Jersey will apply to a considerable extent also to other States.

The average citizen generally pictures to himself as the worst enemy of fish and game the man who goes skulking through the forest looking after traps, or armed with a gun having a caliber of a 10lb. cannon, destroyed everything that presents itself in fur or feathers. Then we also hear of the man who sneaks to the river shore at night with huge nets and with one sweep captures enough fish to supply the fish markets of New York for a week. Again the picture is presented to us of the farmer who jealously guards his property against all trespassers in order that his revenue may be increased by unsportsmanlike methods of taking fish and game. From still another quarter comes a cry that if fish wardens were more vigilant violators of the law would be fewer in number. To offset this there arises a cry that wardens are unmerciful, and frequently enforce the laws to the letter where common sense would dictate the exercise of clemency.

Now I have no doubt whatever that if we could do away with all these objectionable features there would be more fish and game and more happiness generally; but in my opinion we must look further for the causes which tend at the present day toward the decrease of fish and game, and among the first and greatest of these causes I should class injudicious legislation. In the halls of our legislatures protection to fish and game is not always the impulse which actuates the lawmakers in passing laws pertaining to the protection of fish and game. Too frequently laws are introduced and passed for the purpose of attaining some private end, or for the purpose of gratifying some particular friend of one of the legislators; and although these laws, as applied in the particular cases which gave rise to their enactment, may be harmless, they too frequently do mischief in localities for which they were not intended. Then again there is at times a disposition on the part of the lawmakers to go too far—to provide penalties out of all proportion to the character of the offense sought to be punished. What is to be thought of a law, for instance, which provides that corporations which disturb the habits of fish shall be imprisoned for two years, and which gives every justice of the peace in the State the right to impose this penalty? Under this law a justice of the peace in Squedunkville was empowered to send to State prison the Erie Railroad Company, the Standard Oil Company, or any other cor-

poration, officers, directors, stockholders, agents and all, for having interfered with the spawning of a sucker. Still this law existed on the statute books of New Jersey during the present generation, and the commissioners and wardens were by virtue of their oaths of office supposed to enforce it. I might call attention to other laws equally ridiculous which you will find on the statute books of some of the States, but I trust there is no need of my citing any others for the purpose of explaining my meaning. A law in order to be properly enforced must be respected; it must be free from those absurdities which frequently serve as a justification on the part of the general public for a continued violation of a great many of our laws. The public is very quick to perceive the motive of a law, and if this motive does not command respect you cannot hope that the law will do so. If a law is passed for the benefit of a certain individual or a class of individuals, or if its enactment is dictated by politics, it at once becomes inoperative to a certain degree, and, what is worse, the odium attaching to one law is apt to taint all others. Friends of proper fish and game legislation may camp out in the corridors of our State capitols, within easy gunshot of the Senate, the House of Assembly and the Executive Chamber, but in spite of all their watchfulness some obnoxious features are almost sure to creep into laws pertaining to fish and game. Eternal vigilance may be the price of liberty, but you cannot obtain consistent fish and game laws at the same bargain.

The next evil concerning which I desire to say a few words is the direct result of the foregoing. Inconsistent legislation conveys the idea to the mind of the casual observer that fish and game laws are passed for the benefit of a very few and to the injury of the masses. Thus in New Jersey a great deal of fault is found with the laws governing the taking of fish by the use of nets in the inland tide waters. These laws are more numerous even than the bodies of water to which they apply, for some of the creeks have different laws every few miles, and what is lawful on the north shore of a bay may be criminal on the south shore. This inequality of regulation gives rise to numerous complaints, and I cannot say that the majority of these complaints are not well founded. The Commission at the last session of the Legislature attempted to secure the passage of a uniform law concerning tide water; our wardens had ascertained the desires of the people living along the sea coast, and it was presumed that the proposed measure would meet with little opposition. We felt confident that the vast majority of those directly interested approved of the law as suggested by the Commission, but it was this large majority that remained at home, confident that their interests would be taken care of; on the other hand, each individual who wanted some privilege not enjoyed by his neighbors under the old laws, and each man who thought he knew all about salt-water fish and their habits because perhaps he might have smoked herrings or made fish barrels for a year or two, hurried to Trenton, and altogether there was such a din of opposition that the legislators buried the measure in committee. The result is that particular localities and certain individuals enjoy privileges not common to all, and the impression continues that our fish and game laws are not made for the benefit of everybody, but that they confer special rights on a favored few. Our laws pertaining to shad prohibit the taking of this fish on Sundays, and the law is a very wholesome one, as it permits the shad to ascend to their spawning ground unmolested for one day in the week. This law is objected to by some because Delaware, our neighboring State, has no such restrictive legislation. Jersey men complain that they are not accorded the rights enjoyed by their competitors in Delaware. They seem unmindful of the fact that the circumstances in New Jersey are wholly different from those in Delaware, that the shad water over which the latter has control is small compared to the Delaware River, and that laws which apply to the bay would not be suited as well to the river. Still there is here an apparent inconsistency, sufficient to afford an opportunity to the carping critic.

Unfortunately the faults in the fish and game laws are ever being paraded before the public. What is true of the law protecting food fish is also true in a measure of the laws protecting fish whose principal use is to afford sport for the angler. Thus in New Jersey, on account of its geographical position, there is a continual contention between the gunners of the northern and of the southern parts. The former want an early open season and the latter prefer to do their shooting later; and both are right, for there is a difference of two or three weeks in the seasons between the two sections. No matter how the law is framed, it will be partial to one or the other. It is consequently not at all a matter of surprise that people should argue that fish and game laws are made for certain localities and individuals; and not until people alter their opinions, and are taught to believe that fish and game laws are passed for the benefit of all, that they are not intended to be restrictive of the liberty of any person or class of persons, but that their sole object is the preservation of animals for the enjoyment of all who love sport, will our fish and game laws receive that support to which they are justly entitled.

Another evil working against the proper enforcement of the law, and one bearing a close relationship to the foregoing, is the method of conducting politics at the present time. Too frequently are laws dictated by political influence, and too frequently are appointments interfered with in the same manner. Men who are appointed to office, and who are desirous of doing all in their power for the protection of fish and game, are hampered by the power of politics, and this is frequently too great to be ignored. Concessions to those in high political authority are necessary at times, and men intrusted with the enforcement of the laws are required at times to wander from what they recognize as the strict path of duty for the purpose of placating a power which, if offended, might wipe out the entire machinery of fish and game protection. This may not be a pleasing statement to make, but I am willing to leave it to anyone who has had experience in the enforcement of laws whether he has not at times felt the influence of the political boss, and whether such influence was not prejudicial to the cause of sport.

In connection with legislation and the enforcement of the laws I desire to say a few words concerning the attitude of the newspaper press of the State, and I say with perfect frankness that the newspapers have been with us on general principles and opposed to us in nearly every particular. This may seem strange, but it is easy of ex-

planation. The average human being desires to see the perpetuation of useful animals of all kinds, and consequently favors such restrictive or prohibitive legislation as may be necessary to attain that end. It is on this account that the press supports laws and measures advocated by the Commission, and we have no better friends than editors and reporters. But let a violator of the law be brought to book and another tale unfolds itself. The idea of protecting fish and game is all right, but the man who is called upon to pay twenty dollars for having killed a rabbit or a song bird is certain to have the sympathy of a great many people, and this sympathy is almost always reflected in the columns of newspapers. The general principle is lost sight of in the extending of sympathy; the warden's side of the story is not sought for, but everything that may extenuate the circumstances of the offense is dwelt upon, and in nine cases out of ten it is made to appear that the prosecution was unjust and uncalled for. The editors of newspapers and a great many other people seem to be in the position of the character in the play who was in favor of the law, but against its enforcement.

In relation to the men who violate the letter of the law I shall have very little to say. The wardens appointed by the Commission have been doing some very good missionary work; their general terms are \$20 a lesson, although the price charged varies with the conditions of the occasion. I have known cases where wardens out of sympathy for some poverty-stricken offender contributed toward the payment of the fine and costs, and I have known cases where unusually stupid pupils were "kept in" for ninety days. Perhaps two little stories just recurring to my mind may give you some idea as to the character of violators of the law in New Jersey. A warden had made a complaint against a man for having taken three trout under the legal size; the accused promptly admitted his guilt and inquired of the justice how much his experience would cost him. "Sixty dollars and the costs of prosecution," was the reply. "That is rather a high price to pay for three little trout," replied the offender, as he reached down into his pocket for his wallet. "I should say so," chimed in one of those individuals who are so frequently found in courts of justice; "I tell you, these fish and game laws are nothing but outrages on the public; they are made for some brownstone front dudes with silver thing-um-ma-jigs to go fishing, and they are nothing but robbery as far as the poor man is concerned." The defendant stopped for just one instant in the exploration of his pocket, apparently astonished at the interference, and then produced the necessary funds and liquidated his indebtedness to the State. Then, turning to his would-be defender, he said: "I think, my friend, you are mistaken. The fish and game laws are all right, and I should have known better. Even if there were no law against the taking of small trout, I ought to have known better; for I am old enough and have fished enough to know that if all the little fellows are taken out there will never be any big ones. The game laws are made for the poor more than for the rich, for the rich can go to Canada or the Adirondacks and get all the fishing and hunting they want; but the poor have to stay at home, and these men," pointing to the warden, "are trying to preserve some fishing for the poor man. It serves me just right, and I know you are wrong. Come, Warden, have a drink with me."

In another case a warden was called upon by a well-known guide from Greenwood Lake, who said to him: "Mr. Warden, I wish that you would prosecute me. I have been keeping a set line in the water and don't want you to arrest me." "Had you not better wait until I secure the evidence?" inquired the warden. "Oh, no," was the reply; "I have done wrong and I am willing to pay for it. Besides that you will get the evidence fast enough, and then I'll have the bother of going through this when perhaps I have less time than I have now. Besides that, I don't want to have those fellows up there say that I have been arrested, and so I want to square up now." The warden did not exactly like the turn affairs had taken, but the guide insisted, and so the warden accepted the amount of the fine and costs. On the following morning he appeared before the justice of the peace and as warden complained that a certain guide had violated the law; as attorney for the accused he entered a plea of guilty and paid the penalty stipulated by law.

I have said, gentlemen, that our wardens have done some missionary work, and I think you will agree with me as to the quality of this work when you see that it made a defender of the laws out of a man who was paying \$60, and that it touched the conscience of a Greenwood Lake guide. The violators of the law, gentlemen, are with us. Now if we can convince the people that fish and game laws are passed for the benefit of all, and that the faults of these laws are not due to their principle, if we can induce the politicians to keep their hands off, and if we can persuade the press to give us a consistent support, the cause of protection for fish and game will be materially advanced. A campaign of education among the masses will be more fruitful of good results than the application of the rigors of the law to the offenders.

FOREST AND STREAM, published at New York, comes to us regularly, and each issue is full of interest. It recalls to us the many pleasant days we have had in mountain fastnesses pulling the speckled beauties from the cold, rushing waters, or toiling up the side of some rugged slope. It is refreshing to turn from hard mental labor to the perusal of the pages of this paper. To those who love to hunt and fish and climb, the paper will always be welcome, and the way in which it champions the protection of wild game has won for it the confidence of sportsmen everywhere.—*Illinois Wesleyan Magazine.*

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Nov. 17.—Chatham, Ont.—International Field Trial Club's trials. W. B. Wells, Sec'y, Chatham, Ont.
Nov. 23.—Newton, N. C.—U. S. F. T. Club's fall trials. W. B. Stafford, Sec'y.
Dec. 14.—Athens, Ala.—Dixie Red Fox Club's second annual trials. J. H. Wallace, Sec'y.

STUD FEES.

PHILADELPHIA.—*Editor Forest and Stream:* I happened to come across a copy of an English sporting paper a few days ago, one specially devoted to dogs and poultry. In looking over the advertisements of stud dogs, I noticed the extreme difference in the stud fees between the rates asked in this country and the rates charged in England. It is a fact, I think, that good dogs command a higher price in England than they do in this country, all the imported dogs costing a handsome figure and the references to English sales almost invariably refer to high prices. The stud fees for dogs of good breeding and with some fame as winners ran from £2 up to £6, rarely higher, and then the higher price seemed to be warranted by the dog's individual merit, purity of blood and great success in competition. Some of the stud fees were as low as £1.

No doubt the more reasonable rate of stud services enables breeders to keep in the dog business, where otherwise they would be forced out of it. Moreover, they can sell good dogs at a cheap figure, which in turn places them within the reach of those whose love for the dog is great while their bank account may be small. This keeps up a general interest in the dog world, and places it on a permanent basis. People can then keep dogs without suffering from the discouraging expense consequent on high prices. When the financial capability of men is strained to the utmost in keeping a kennel, a slight depression in business is sufficient to force them out of the fancy. Dogs should be on a basis within the means of all. They should not be made an expensive luxury. The higher the price, the fewer the number who can afford to own well-bred dogs. But as the love of the dog is irrepensible in man, when he can not own a well-bred dog he contents himself with the ownership of a cur, so that high prices in well-bred dogs tend directly to the encouragement of the cur.

From a business standpoint, there is nothing to justify the charge of \$50 or \$75 or even \$100, as is usual. If a stud dog costs \$500 there is nothing to justify a charge of \$50 for a stud fee. The price is often paid for the reputation gained from one performance either on the bench or in the field, regardless of whether the performance was a fluke or from specially favorable opportunity, or from weak competition.

The disproportion between the value of the dog and the stud fee is more distinctly shown in comparing them with the business of horse and cattle breeding, wherein a \$50 or \$100 stud fee represents anywhere from \$10,000 to \$50,000 invested. The death rate is incomparably less in cattle and horses than in dogs, hence the owner gets a greater corresponding return from his cows, oxen and horses, besides having the advantage of an established market value instead of a value fixed by individual and passing fashion. This is a matter worthy of the study of breeders. Their own interests are hurt by high prices. The dog, being a sentimental appendage to a home, cannot be cultivated by the masses if his price is beyond their reach. His life at best is short. His market value is what it may happen to be. When money is plentiful, much of it may be spent carelessly. With a stringency in money comes a more careful disbursement. Make the prices so that people can buy. If the dog business is dull and high prices are still made, breeders have only themselves to blame for the consequent dull market. H.

National Beagle Club of America.

A FIELD trial committee meeting of the National Beagle Club of America was held at the rooms of the American Kennel Club, 55 Liberty street, New York, June 5. The members present were Messrs. J. W. Appleton, chairman; Hermann F. Schellhass, Geo. B. Post, Jr., A. Wright Post, John Bateman, George Laick, N. A. Baldwin and George W. Rogers.

The committee on selecting judges submitted the following names to officiate as judges at the club's coming field trials, to be held at Hempstead, L. I., during the week commencing Oct. 26: Mr. Bradford S. Turpin, Roxbury, Mass., and Charles Quynn, Frederick, Md., who were duly elected.

The first Futurity to be introduced at any field trials will be held at these trials. The number and quality of the dogs nominated will insure a hot race in this event, that will interest all lovers of the beagle. The club has received up to date forty entries in the '97 Futurity stake, and by this time next year the number of entries that will be received promises to make this event a permanent feature at the trials that will attract a large number of entries.

GEO. W. ROGERS, Sec'y.

Diplomatic Snap.

Editor Forest and Stream:

Numbers of your contributors have given amusing and interesting recitals of exhibitions of high intelligence on the part of their various canine friends; but I do not recall any case where a dog was shown to be an habitual and deliberate liar. I once owned such a dog when I was a small boy. This was a small dog of uncertain breed, mainly terrier, I believe. His color was white ground with brown spots. His name was Snap. The neighbors dignified him by calling him Snap as a prefix, and adding our family patronymic as the other part of his name.

Snap was very active and energetic, both mentally and physically, and withal was so officious that he poked his nose into nearly everything, both actually and metaphorically assuming on all occasions to be about the most important personage on the premises. My father, who lived in a small town, was accustomed to purchasing ready-dressed hogs in the winter, and cutting them up would cure the meat in his own smoke-house. On such occasions Snap would voluntarily assume the guardianship over or rather under the hogs as they hung on a pole during the night. He would remain all night out in the cold, lying under the hung-up pork, and would not permit a cow or horse, or anything else, to approach within 20 or 30 yds.

On one occasion a brood of young chickens turned out without a mother. They were placed temporarily in a barrel that stood in the yard. Without suggestion from any source Snap assumed the charge of these orphan chickens. He laid himself down by the barrel, at short intervals jumping up and placing his forefeet on the upper edge, to look down at his self-appropriated charges. He would not permit any chicken, turkey, horse or cow to approach the barrel. But I started out to tell about Snap's prevarications.

There stood in the back entry of the house a lounge, which Snap was very fond of reclining upon; but my mother invariably whipped him off when she found him there. So Snap took his naps on the lounge with one eye open and one ear cocked up. Whenever he heard any one approaching during these stolen siestas, he, with a great show of vigilance, rushed out into the back porch and barked fiercely and vociferously, as if he was on the point of tearing to pieces some intruder. These tactics he invariably pursued, to our great amusement, evidently with the deliberate purpose of creating the impression that he was at the post of duty, and full of zeal to guard the house against any invasions of unauthorized man or beast. This is as palpable lying as was ever practiced by any biped.

COAHOMA.

American Spaniel Club.

At a meeting of the executive committee of the American Spaniel Club, held at Dr. S. J. Bradbury's office, 110 East Twenty-second street, on Tuesday, June 9, there were present: E. M. Oldham, President; Dr. S. J. Bradbury, Treasurer; Mr. M. A. Viti, and Rowland P. Keasbey, Secretary. Resolutions upon the death of the late Dr. Nicholas Rowe were adopted.

The committee on changes in the classification reported that they had made a new classification.

The inclosed classification was read and adopted to go into effect at once: Field spaniels, over 28lbs., challenge classes, dogs and bitches respectively; field spaniels, black, over 28lbs., open classes, dogs and bitches respectively; field spaniels, any other color, over 28lbs., open classes, dogs and bitches respectively; cocker spaniels, black or liver, not over 28lbs., challenge classes, dogs and bitches respectively; cocker spaniels, any other color, challenge class, dogs and bitches; cocker spaniels, black, not over 28lbs., open classes, dogs and bitches respectively; cocker spaniels, red or liver, not over 28lbs., open classes, dogs and bitches respectively; cocker spaniels, any other color, open classes, dogs and bitches respectively; Clumber spaniels, challenge class, dogs and bitches, open class, dogs and bitches; Irish water spaniels, challenge class, dogs and bitches, open class, dogs and bitches.

The meeting adjourned until some time in July, when the question of field trials will be taken up and acted upon. Mr. H. K. Bloodgood has offered the club the use of 2,000 acres at New Marlborough, Mass. The American Spaniel Club's second annual sweepstakes for sporting spaniels over 28lbs., whelped in 1896, to be judged at the Westminster Kennel Club's show in 1897. Forty per cent. of the stakes to go to the first prize, 30 per cent. to the second, 20 per cent. to the third, and 10 per cent. to the fourth. The club to add at least \$30 to the stakes. The president of the Spaniel Club also offers a silver medal to the winner of this stake. Entries for this stake to be as follows: Nominations made on or before July 1, 1896, to be accompanied by \$1 entry fee. Nominations not made by July 1, and made on or before September 1, to be accompanied by a \$2 entry fee. Nominations not made by September 1, and made on or before November 1, to be accompanied by a \$3 entry fee. No nominations received after November 1. The final entry fee of \$3 to be paid on or before January 1, 1897. All nominations upon which final fees are not paid by January 1 to be forfeited to the stakes.

New England Beagle Club.

LINDEN, Mass., June 7.—*Editor Forest and Stream:* A field trial committee meeting of the New England Beagle Club was held at the residence of Mr. A. D. Fiske, Worcester, Mass., June 7. President Joslin in the chair. There were present Messrs. H. S. Joslin, A. D. Fiske, Thomas Shallcross and W. S. Clark. The only business to come before the meeting was the selecting of judges for the fall field trials, and Mr. C. J. Quynn, of Frederick, Md., and Mr. B. S. Turpin, of Dorchester, Mass., were unanimously elected. W. S. CLARK, Sec'y-Treas.

The Pointer Club Trials.

NEW YORK.—*Editor Forest and Stream:* What is the Pointer Club thinking about giving the announcement with such great flourish to hold a trial equal to any of them, and having at this time given not the first real intimation thereof? What owner or handler will prepare himself or dog for such uncertain affairs? I will predict now that the whole matter will fizzle down to (at least this year) a love affair between members only.

A POINTER MAN.

American Dachshund Club.

THE fifth meeting of the American Dachshund Club was held on June 11. New members joined as follows: C. M. Trowbridge, Worth Kennels, Hudson, N. Y.; J. R. Walker, La Grange, Ill.; G. Muss-Arnolt, Tuckahoe, N. Y.; Carl Boening, 233 East Twenty-second street, Chicago.

The club recommends for judges: G. Muss-Arnolt and Jas. Mortimer.

The secretary was instructed to make proper arrangements with the show committees in regard to classifications, and to have a pamphlet printed containing the constitution, the by-laws and the standard of the club.

The club will offer, in addition to the Venlo Challenge cup and the Klein's Breeder's Trophy, two special prizes of \$5 each, at every show where two or more members compete. The officers elected were: L. Boening, President; C. M. Trowbridge, Vice-President; A. Froembling, Secretary-Treasurer.

POINTS AND FLUSHES.

Mr. Horace Cox announces for early publication a new and enlarged edition of "The Terrier" division of Rawdon Lee's "Modern Dogs." Among the most important alterations and additions are the illustrations of bull and some other terriers with their ears uncut, a departure necessitated by the recent discontinuance of such mutilation. The drawings are by Arthur Wardle.

From the *Breeder and Sportsman* the following is taken: "J. O. is Fellows (Uncle Dick), the judge of the Los Angeles and Oakland dog shows, started for the East on June 2. He goes via Portland and will spend a few days in Montana with McDougal, the well-known greyhound fancier. Uncle Dick had a royal good time during his stay on the coast and will remember his two days' stay in Stockton for many years. He has made many friends during his sojourn in this State and will undoubtedly be asked to return in the fall to judge at Stockton and San Jose."

The following, clipped from the New York *Herald*, adds one more contribution to the testimony concerning the dog's intelligence and devotion. It also shows how little a dog is understood by his owner. But the story speaks for itself: "A little Irish setter named Pat, owned by Charles Wallott, of Brooklyn, saved two lives last night, and is likely to be regarded with reverence by the dwellers in the tenements near his master's home. Pat is devoted to Mr. Wallott's two sons, respectively 15 and 17 years old. They sleep in a room on the top floor of the two-story building occupied by Mr. Wallott, and usually go to bed early. The lads were fast asleep a half hour before midnight last night, when a night lamp in their room exploded and set some of their clothing afire. Pat saw the blaze as he was dozing at the foot of their bed, and jumping up, began barking and then ran downstairs, howling louder with each bound until he found Mr. and Mrs. Wallott, who were sitting in front of their door chatting to some neighbors. Pat danced around Mr. Wallott, barking and howling alternately, striving in every dog-like way to attract his master's attention. Mr. Wallott drove him away twice, and threatened to whip him if he didn't stop his noise. The threat didn't frighten Pat a bit. He finally took Mr. Wallott's trousers leg in his teeth and fairly pulled him into the house, where, looking up, Mr. Wallott saw flames in the boys' room. He rushed to his sons' rescue, and found the room filled with smoke. He groped about and finally found his younger son unconscious on the bed. The elder was wandering about, endeavoring to find an exit from the room. Mr. Wallott led and carried his children downstairs, whence they were taken into the house of friends. The younger son was revived there after a short time, and the firemen succeeded in extinguishing the flames after they had done damage amounting to about \$1,000. The alarm of fire caused a panic among the inmates of the big tenements which adjoined Wallott's house, and in a short time after Pat had succeeded in giving the alarm the street was filled with men and women in their night clothing waiting for their homes to be consumed. The flames, however, were confined to Wallott's house. Pat has been owned a few months, but the dog has devoted himself to the two boys. Now all the members of the family will devote themselves to Pat."

The judges at Providence are as follows: George Jarvis, New York, English setters and Gordon setters and pointers; George S. Thomas, Salem, Mass., greyhounds, foxhounds, beagles, bull dogs, fox, Scottish, Bedlington, bull, Irish, Black and Tan, Skye and Yorkshire terriers, poodles, Great Danes, dachshunde and pugs. Dr. S. J. Bradbury, all sporting spaniels. C. F. Clarkson, Cambridge, Mass., Boston terriers. All other breeds, James Watson, New York. The Boston Terrier Club offers the following special prizes, open to club members only: \$10 for the best dog, bitch and puppy respectively, and the club's silver cup for the best dog or bitch never before shown.

Mr. Thos. Hitchcock, Jr., was severely injured in a runaway accident on June 15. He, with his brother, Mr. F. R. Hitchcock, were riding after a spirited horse near the depot at Westbury, L. I. The horse took fright, upset the vehicle, throwing Mr. Thomas Hitchcock, Jr., on top of his head, injuring him severely. Mr. Frank Hitchcock was bruised and shaken up, but not seriously injured.

As evidence of the enthusiasm with which the revival of the trials has been received in Ireland, we may mention that at the last meeting of the committee of the Irish Kennel Association it was decided to establish a fund with the object of purchasing a grand challenge cup to be offered for competition on the occasion. The exact conditions under which the cup is to be offered have not yet been decided on, but there is every probability that, as befits its importance, it will be for the best dog at the trials—setter or pointer.—*The Stock-Keeper (England).*

From the *Herald* we learn that the greyhounds of the late Colonel North were sold at auction on June 13. The sum realized was far less than expected. The hound Young Fullerton, son of the Waterloo cup winner, was bought in, the price offered not being satisfactory. The hound Duennium Ago, which cost Colonel North 1,050 guineas, fetched only seventy guineas, Simonian was

knocked down at 150 guineas. Nestor, twenty-one guineas, and Old Boots at five guineas.

Owing to the absence of a quorum there was no meeting of the Metropolitan Kennel Club on June 11, the date appointed for the meeting. If the club does not take some definite action soon, it will attain to the dignity of a landmark.

Yachting.

FIXTURES.

The annual regatta of the New York Y. C. came near being a case of a very small tail wagging a very large dog. In spite of the efforts of some members of the club to extend the right of representation to the owners of the smaller yachts down to 10 tons, the one racing class of the year is denied official recognition by the club. On the day of the annual regatta, however, a special race was arranged for the 30ft. class, not as a part of the regatta, but as a distinct and separate affair. The usual programme of the regatta contained no mention of the special class, and no intimation that any member of the club had ever fallen so low as to own a "yot" of less than the required tonnage. At the same time the club issued a separate circular concerning the race for the 30ft. class, over a new and special course up Raritan Bay from the Split. After the "regatta" was started the yacht race was also started by the same committee. By great good luck for the club Colonia turned up to give battle to Emerald, otherwise the members on the steamer would have gone off one way after a lot of old yachts, one in each class, while a fine fleet of eight modern racing yachts were sailing a hot race in another. As it was, the fighting of the thirties was the one thing beside the race of the two schooners that a yachtsman would care to look at.

It may be all right to limit the voting power in a very large club, but the limit of mere size of yacht is a most absurd one to-day. A man who buys an old tub of a schooner for \$1,000 is, as a matter of course, competent and qualified to vote on the affairs of the club. A man who owns a racing 30-footer costing three or four times that amount is not thus competent.

We notice with pleasure that one British yachting journal, the *Yachtsman*, has taken a view of the Niagara incident that is not only fair and just, but marked by plain common sense; something that cannot be said of the remarks of the *Field*, echoed almost *verbatim* by the *Yachting World* and the comments of some yachtsmen. We can understand, after all the talk about the misuse of ballast on Vigilant, Defender and Ethelwynn, and in view of the novelty, to British eyes, of the simple device of carrying water in tanks connected by a pipe, how suspicion has arisen; but there is at the same time no justification whatever for such action as has been taken on the complaint, apparently, of some anonymous member of the Y. R. A. Far from being a stranger and unknown, Mr. Gould has raced for three seasons in British waters in Vigilant and Niagara, and both he and his brother have shown themselves to be exceptionally good sportsmen, in that they have neither boasted before a race nor whined afterward when they were beaten. Neither the failure of Vigilant nor the equally notable success last year of Niagara has called from them complaints or boasts.

With the reputation which he has made abroad, Mr. Gould was fairly entitled to very different treatment from that accorded him by the Y. R. A.—a hasty examination of his yacht on the ground of an anonymous complaint that was without justifiable foundation. The description of the size, location and arrangement of the tanks given by the *Yachtsman* shows just such a state of affairs as we outlined last week, a simple and convenient plan of carrying fresh water, and one that at the same time could not possibly be used to any good purpose for shifting ballast to windward. The small weight of water, the limited distance from the centerline at which the tanks are located, the long time necessary to run the water from one tank to another, and the fact that water will not run up hill, are all against the truth of the accusation, and should have appealed not only to the expert, but to any yachtsman of average intelligence.

So far as we can judge from the reports, instead of assuming that Mr. Gould was all that his previous conduct would imply him to be, and acting on this assumption, the suppositious infringement of the rule has been as widely and publicly exploited as possible, and in a way to awaken a very general suspicion of another "Yankee trick." We hope at least that the author of the complaint will be compelled to disclose himself.

Niagara's Water Tanks.

From the *Yachtsman*.

The activity of the Y. R. A. Council is becoming quite phenomenal. Time was when our ambition soared no higher than to wake that once lethargic body into some semblance of life, and, whether through our kindly influence or not, it has of late years shown many symptoms of a commendable enthusiasm. Indeed the great difficulty to contend with now is to direct all the new-born energy of the Council in the right or, at all events, into harmless channels, but that this is not always possible has been illustrated recently in a most unfortunate manner. Our readers will remember the incident of the collapse of the Royal Sovereign's steering gear during the Royal Thames match on May 22, for this has been duly reported in these columns. But we did not mention a fact that was known to many on board, viz, that a Y. R. A. Council meeting utilized the opportunity to consider a report made to it that Niagara was fitted with water tanks capable of being used for shifting ballast.

Now, no doubt the Council was bound to inquire into the truth of this "report," and it did so in the proper way—by sending three representatives aboard the yacht at the conclusion of the race. Fortunately the repairs to the Royal Sovereign's steering gear were completed in

time to enable these magi to board the yacht before the skipper had an opportunity of concealing his suspected mechanism. On May 27 the Secretary of the Y. R. A. wrote the following letter to Mr. Howard Gould, which, no doubt, was intended to be as agreeable as any communication of such a nature can be made. Our readers may judge of its recipient's joy:

"YACHT RACING ASSOCIATION, 24 Sussex Gardens, Hyde Park, London, W., May 27, 1896.—*Dear Sir:* A report was made to the Council of the Y. R. A. that your yacht, Niagara, was fitted with a water tank under the seat on each side of the cabin, and that these tanks are connected by a pipe, so as to make it possible by merely turning a cock to run the water from one tank to another, and thus use them for shifting water ballast, which might be advantageous in certain cases.

"Three members of the Council were in consequence requested to inspect the tanks, which they did immediately after the race of the R. T. Y. C. on the 22d inst., and in your absence were afforded every facility by Captain Barr.

"The members of the Council do not wish to convey any idea on their part that the tanks have been used for the purpose indicated—on the contrary, their impression was the other way; but I am requested to suggest that, in order to place the matter beyond suspicion, it would be desirable to make it impracticable to run the water from one tank to the other, which could be readily done by a small alteration of the pipes. I should be glad to hear, for the information of the Council, that this will be done at once." Faithfully yours,
"To Howard Gould, Esq." "DIXON KEMP, Sec'y."

Now, we happen to have seen the water tanks on board the Niagara, and the true state of the case is this: There is absolutely no room whatever under the floor for any tanks, and the builder, with his usual astuteness, hit upon this "arrangement" that we are not used to on this side of the Atlantic (as the *Field* puts it), just as he has taught us many other things that our designers did not know before. True, there is a connecting pipe between the two tanks (which, by the way, are only a foot or so below the l.w.l.), and there is a cock in this pipe for the obvious purpose of preventing the water of one tank from running into the other when the yacht is under way. If that cock were not there, there would certainly be a shifting of ballast—to leeward. As it is, water can be put into both tanks at once, and when a sufficient supply has been taken, the cock shuts one tank off from the other. Now, we quite fail to see how these tanks could be used for shifting ballast. It takes nearly ten minutes for one, when filled, to empty itself into the other, and this can only be done when the yacht is heeled. We presume that nobody contemplates the possibility of the leeward tank suddenly running its contents up into the weather one. Another kindly suggestion has been made—viz., that because the tanks are of copper they are unfit to carry fresh water. But if Mr. Herreshoff has made this great mistake, the tanks are surely available for the supply of washing water—and the Niagara has a standing crew of seven hands.

We regard this incident as peculiarly unfortunate, because the suspicion, which many men would treat as a gross insult, has attached to a foreign gentleman, and one who has done much for British yachting, and who is known to be a thorough sportsman. But the fact that Mr. Gould is an American makes the matter still worse, for, notwithstanding any disclaimers, yachtsmen in America will regard this as a national insult. As we have said, the Y. R. A. Council acted promptly enough in view of the "report" made to them, but we think that everyone is entitled to know who made this report. The members of the Yacht Racing Association, at all events, are within their rights in asking for this information.

The *Field* of June 6, in connection with the two letters which we published last week, has the following explanation: "[In the article referred to the following passage occurs: 'The tanks were found to be fitted underneath the sofa seats in the bilges, and are connected by a pipe, so it was quite obvious they could be used as a shifting water ballast. The captain states the tanks were used for carrying fresh water on passages. No proof appears to exist that they have been so used.' The words, 'no proof appears,' etc., by some accident got transposed and the sentence should have read, 'It was quite obvious they could be used as shifting water ballast; no proof appears to exist that they have been so used.']"

The *Field* might well have gone further in correcting the entire sentence, as it is by no means obvious how, in the absence of a pump or similar appliance, the water could be forced into the weather tank. The small diameter of the connecting pipe would make it impracticable to obtain any advantage by allowing the weather tank to empty into the lee one prior to going about.

Shackamaxon Y. C. Annual Regatta.

PHILADELPHIA—DELAWARE RIVER.

The ninth annual regatta of the Shackamaxon Y. C. was sailed on June 10 over the regular course from the stakeboat anchored off the club house at pier 49½ Delaware River, to Wheat Sheaf Bar Buoy at the upper end of the Wheat Sheaf Bar and return, distance 30 miles, the wind being southwest, a free run to upper buoy and dead to the windward to the home buoy.

Thirty-two yachts started: nine third class, nine second class, nine first class and eight fourth class.

The times were:

THIRD CLASS—START 11:20.			
	Upper Buoy.	Home Buoy.	
McGinty, Capt. Abel Pedlow.....	1 38 00	4 40 40	
Elsie.....	1 33 00	4 41 30	
Nana.....	1 34 00	4 43 00	
SECOND CLASS—START 11:35.			
Woodman and Florrie, George Smith.....	1 57 22	4 38 00	
Mabel, Albert James.....	1 56 35	4 39 00	
Budwise, Wm. Shane.....	1 56 00	4 40 00	
FIRST CLASS—START 11:41.			
Emma A., Henry S. Anderson.....	2 32 15	5 07 00	
Annie, Charles Stanford.....	2 29 00	5 08 00	
Edith M., Charles Shalleross.....	2 30 20	5 13 30	
FOURTH CLASS—START 11:45.			
Millie.....	2 22 45	4 53 30	
Sallie B.....	2 22 40	4 54 15	
Emma.....	2 27 45	5 05 00	

The judges were Samuel Baizley, Shackamaxon Y. C.; John McKane, Keystone Y. C., Tacony; and John Rowland, Southwark Y. C.

She regatta committee included Fred Anderson, Max Schladsensky and Wm. Jones.

The officers of the club are Com. James Slemmer, Vice-Com Charles Baierle, Sec. Henry S. Anderson, Fin. Sec. R. B. Murphy, Treas. James Slemmer, Fleet Capt. Charles Stanford.

Oceanic Y. C. Annual Regatta.

SOUTH BROOKLYN—NEW YORK BAY.

Saturday, June 13.

The Oceanic Y. C., of South Brooklyn, sailed its annual regatta on Saturday over courses on the Upper Bay, the times being:

CATBOATS—25FT. AND OVER.

	Finish.	Elapsed.	
Anna K., James Kane.....	4 01 07	1 34 07	
Ripple, A. James.....	4 14 09	1 42 16	
Dolphin, J. W. Reynolds.....	4 09 03	1 49 31	
B. K. W., P. A. White.....	3 55 20	1 28 45	
Charley, C. W. Buns.....	3 56 00	1 29 00	
Winnie, H. Patterson.....	3 56 16	1 29 16	
SECOND CLASS—24FT. AND UNDER			
Gotham, F. Johnston.....	4 12 42	1 42 22	
Vanquish, C. Clement.....	4 16 31	1 46 13	
W. G., J. Wissner.....	4 12 40	1 45 10	
Victor, A. Mertheus.....	4 12 10	1 45 30	
Dreadnaught, C. Wise.....	4 18 31	1 45 29	
THIRD CLASS SLOOPS.			
Jennie, Dr. Kahn.....	4 02 45	1 31 22	
Rax, C. Wise.....	4 14 56	1 43 05	
Wille, J. Beasner.....	4 14 57	1 43 06

SPECIAL.					
El Sueno.....	3 43 52	4 50 35	1 06 43	Withdrew.	

YACHTING NEWS NOTES.

The Race Committee of the Seawanbaka Y. C. have issued the following: "Owners of yachts who contemplate making entries in any of the regattas to be held by the clubs of the Yacht Racing Union of Long Island Sound, of which organization this club is a member, are requested to apply immediately for permanent racing numbers to Messrs. Rehm & Co., of No. 157 Fulton street, New York. In the application it is necessary to state the name of the yacht, class and rig. In view of this arrangement the clubs of the Y. R. U. will not hereafter provide racing numbers. The attention of members is called to an error in the 'Schedule of Seawanbaka Racing Events,' recently issued, in which the dates of the International Challenge Cup Races are erroneously given as July 15 and succeeding days until decided. This should be corrected to read July 13 and succeeding days until decided."

We have received from the J. B. Lippincott Co., Phila., a copy of a new work which we can recommend to all interested in yachts and vessels generally. The book, which is one of the "Nautical Series," published by the Lippincott Co. in this country and Chas. Griffin & Co. in London, is called "Know Your Own Ship." The book, according to the subtitle, is "a simple explanation of the stability, construction, tonnage and freeboard of ships; specially arranged for the use of ships' officers, superintendents, draftsmen and others, by Thomas Walton, N.A., lecturer to ships' officers, Government Navigation School, Leith." The book contains in a condensed, simplified and practical form a great amount of information relating to vessels that is practically inaccessible to the average reader because it is to be found only in large and expensive works, in connection with the more intricate and abstruse portions of naval architecture, and often set forth in a form only intelligible to the student. Beginning with displacement and taking up in turn such subjects as moments, buoyancy, strain, structure, stability, etc., Mr. Taylor has succeeded admirably in setting forth the main facts in a simple form; the manner of treatment being similar to that attempted in the present series of articles on "Yacht Designing" which we are now publishing. Such subjects as stability and metacentric height are treated in language within the reach of any intelligent reader. The book is devoted, so far as specific examples go, solely to merchant vessels, and does not touch upon yachts; but the yachtsman will find it a most useful work and well worth his careful study.

The novel and useful form of Coast Pilot introduced by N. L. Stebbins, of Boston, the yacht photographer, a few years ago, in which the latest sailing directions are supplemented by photos taken by Mr. Stebbins of the various lighthouses, beacons, buoys and other marks, has just reached a second edition, materially revised and extended so as to include the two books originally issued to cover the Atlantic coast. The new book, a long quarto in a canvas cover, embraces the coast from Galveston to Bass Harbor, Me. It is illustrated by a very large number of reproductions from photos showing all the aids to navigation on the coast. It is needless to speak of the utility of the book in picking up strange landmarks, the pictures show at a glance what might not be revealed by a close study of many lines of print. The book has met with deserved favor from yachtsmen, steamboat men and small coasters.

Lloyd's Yacht Register for 1896 calls for little comment in addition to what we have often before said of it, as it has long since reached a point where the only field for growth was in size. It is the same handsome and comprehensive green and gold volume, with an extended and corrected list of yachts, both British and foreign. Among the new yachts enrolled are Varuna, designed by Watson and building by A. & J. Inglis for Eugene Higgins, 1,500 tons, 264ft. b. p., 35 1ft. beam and 18.3ft. hold; Margarita, also designed by Watson and building at the Alisa S.B. Co.'s yard, Trood, Scotland, for A. J. Drexel, 1,322 tons, 253.5ft. b. p., 33.7ft. beam and 18.4ft. hold; and a third, still larger, designed by Watson and building by J. & G. Thomson, Glasgow, for Ogden Goellet, 1,737 tons, 279.5ft. b. p., 36.67ft. beam and 18.3ft. hold. All of these will have quadruple expansion engines. The book may be had of Thomas Congdon, principal surveyor of Lloyd's for the United States, Kemble Building, Whitehall St., New York.

The Larchmont Y. C. has issued the following circular relating to the 34ft. and 30ft. special classes:

It is the intention of the club to give eight races for these classes during the season of 1896.

For each race the club will give an appropriate record prize to the winning boat and a like prize to the second boat in each class, if four or more boats start, and a like prize to the third boat if eight or more boats start.

Com. H. M. Gillig offers two valuable prizes to be awarded at the end of the season to the yacht which has won the greatest number of first prizes in her class.

The Larchmont Y. C. offers two prizes to be awarded at the end of the season to the yachts which have won the greatest number of points in their respective classes in such races, the points counting as follows: The winner in each race shall be credited with four points. The second yacht in each race shall be credited with two points. The third yacht in each race shall be credited with one point.

If either yacht in her respective class winning the greatest number of races should also have won the greatest number of points, such yacht will receive the commodore's prize, and the yacht winning the second largest number of points will receive the prize offered by the club.

In case of a tie for either prize, the tie will be sailed off in a special race. John E. Lovejoy, Otto Sarony, Henry C. Wintringham, Regatta Committee.

We have received from a correspondent a photo of a yacht, a snap shot taken from a passing steamer in the Narrows, New York Bay, on May 31. The photographer is ignorant of the name of the yacht, but offers to send a copy of the photo to the owner should he make himself known. The picture, which is a very good one, shows a yawl, in model similar to a Cape cat, with a plumb stem and short counter, and long low cabin house. She is on port tack, with two reefs in mainsail and whole mizzen and jib, apparently heading north on the wind. We shall be glad to forward the picture to the owner on application.

The year book of the New York Y. C. for 1896 is a large volume, the largest of its kind, containing the constitution, by-laws, racing rules, etc., of the club. The private signals of 490 members are given, the total membership of the club being nearly 1,200.

We are indebted to the secretary of the Corinthian Y. C., of Marblehead, for a copy of the club book for 1896. The club, now in its twelfth season, has met with remarkable success through the spirit and good management of its founders and their successors, and is now in a most prosperous condition.

The first of the three yachts building by the Racine Boat Manufacturing Co. was launched on June 4. She is named Siren and was designed by a Chicago yachtsman. The other two are Vincedore, the Berriman yacht for the international race, and Vanenna, owned by W. R. Crawford, of Chicago. The latter is a bulb-fin, in model and dimensions similar to Niagara.

Lasca, schr., has been sold by John E. Brooks to James L. Watson, of Rochester, owner of the steam yacht Algonquin, formerly Gadabout IV.

The Board of Commissioners of Lincoln Park, Chicago, has at length agreed to the plans of the Lincoln Park Y. C., and that club will be aided in constructing a suitable basin and anchorage such as have long been needed at Chicago.

The Eastern Y. C. has arranged the following programme for the season: June 27, race for knockabouts; July 20, race for knockabouts; Aug. 15, racing run from Vineyard Haven to Marblehead, with prizes for special 30ft. class and other seventh class sloops; Aug. 18, races for special 30ft. class, other seventh class sloops and knockabouts; Aug. 19, races for special 30ft. class and other seventh class sloops; Sept. 19, race for knockabouts. No announcement has yet been made concerning the annual regatta.

The Rochester Y. C. has issued a very neat little club book, with list of members and yachts, etc. The club opened the season with a cruising race to Sodus on May 30 and a cruise home next day. The little cutter Iris, owned by F. T. Christy, made a remarkably good showing on both occasions. The first club race will be on June 27, the squadron review on July 4, ladies' day July 9, with club races on July 18 and 30, Aug. 8 and 27.

On June 9 a steel steam yacht was launched at the yard of the D. R. I. S. B. and S. E. Co. for Stephen W. Roach, owner of the steam yacht Emmeline. Parthenia, as the new yacht is named, is 142ft. over all, 115ft. 9in. l.w.l., 18ft. beam and 9ft. hold, with triple expansion engines, 25, 16 and 9 by 14in. She has Almy boilers and her wheel is three-bladed, 6ft. 6in. diameter and 7ft. pitch.

Vice-Com. Henry C. Ward, N. Y. Y. C., schr. Clytie, has offered a very handsome loving cup, to be called the Walrus cup, to the schooner of the New York Y. C. which shall win the greatest number of runs on the annual cruise.

The Indian Harbor Y. C. will hold a special race on Tuesday, June 30, open to yachts of any recognized yacht club, the committee reserving the right to reject any entry. The classes will be special 30ft., special 21ft., special 34ft., 15ft., all without time allowance; cabin cats, 30ft. and under; open cats, all sizes, shifting ballast; open sloops, all sizes, shifting ballast. The race will be under the rules of the Y. R. A. Entries must be made in writing to George E. Gutland, 11 Wall street, from whom all particulars may be obtained.

Thirty-foot Class, Special Race.

NEW YORK BAY.

Thursday, June 11.

The first important race of the new 30ft. special class took place on June 11 on New York Bay, the weather conditions being such as are but too seldom met with about New York in early summer—a strong, true wind all day from W.N.W., with smooth water, the weather being clear and just cool enough for both yachtsmen and spectators. The one serious drawback was the lack of any means of following the boats, so that but a small part of an exceptionally fine display of yacht racing was seen by others than the contestants and some of the clam-mers about Sandy Hook. The race was a special one, for prizes given by the New York Y. C. of \$75, \$50 and \$25, and it was started by the regatta committee of the club. The course was a special one, as follows:

From a line between Buoy 13 and the committee boat anchored east of it, two cables' length; around Buoy 12, near Southwest Spit (red nun with perch and ball), leaving it to starboard; around float displaying red flag with white stripe, one mile S., half W. from Old Orchard Shoal Light, leaving it to starboard, to a line drawn as for the start. Buoy 9 (west bank) and the bell buoy, midway between buoys 9 and 11 (west bank), must be left to the westward both going and return-ing.

The starters were: Hera, R. N. Ellis; Wawa, James Stillman; Es-peranza, A. S. Van Winkle; Vaquero III., H. B. Duryea; Mai, O. G. Jennings; Departure, C. B. Seeley; Musme, J. M. MacDonald; Asahi, Bayard Thayer.

Departure is the new Gardner sharpie fin-keel, the others being all Herreshoff boats.

While half a dozen of the boats were in a close tangle at the weather end of the line awaiting the gun, Wawa, sailed by Edmund Fish, went over the leeward end with a rush and with nothing to trouble her. This fine start she soon improved into an open lead of the fleet, which she held all day. She was one of several, including Musme, sailed by J. F. Lovejoy, which had the good judgment to turn in a single reef before the start; Musme soon shook herself free from the others and took second place for the day. As they went reaching down by the west bank, those with reefs having all the sail they wanted and the others luffing and begging with very much more, they made a fine sight, with their bright mahogany topsides and pine decks. Taken in detail at anchor their appearance is not specially pleasing, the bow has an awkward knuckle and the bowsprit is very short, suggesting the idea that the yachts would have been quite as good and much handsomer if the limit of over all length had been made large enough to admit of a jib tack at the stem head, as in El Chico and the older Herreshoff fms. The transom and counter of the new model, how-ever, is more yacht-like and shapely than in El Chico and Weonah. While the mahogany topsides and white pine decks show in very pleasing contrast, the use of oak for the wales, as in all the Herreshoff craft, entirely destroys the sheerline, making the deck look too wide and the side too low. The cabin houses, alike on all, are suggestive of the promp-ter's box at the opera or some other unshipshape and land-lubberly construction, and detract very much from the appearance. When under way, however, and in such a breeze and bobble as on Thursday, all of these defects disappear and only the good points of the boats are visible; they are wonderfully lively and quick in all their movements and make a beautiful marine picture. The Gardner boat was visible only from the lee side and at a disadvantage, but she too has a peculiar streak of ugliness in her sharpie stem, with its abrupt angle just above the water; she seemed to trim very much by the stern and showed re-markably little freeboard. The cabin house was less painfully in evi-dence than in the other boats.

With wind and tide both helping they went gayly along by the west bank and down the main channel, Wawa first, Musme second, then Vaquero III. and Mai, both with whole sail and staggering under it, Hera, Esperanza, Asahi and Departure. This order was maintained as long as they were in sight, but the greater part of the race, the reach across to the markboat after luffing round the Spit Buoy, and the third reach home on the other tack, was lost in sight. The race was officially timed:

	START 11:30:00.	Finish.	Elapsed.
Wawa.....		1 58 54	2 27 54
Musme.....		1 59 54	2 28 54
Asahi.....		2 00 39	2 29 39
Esperanza.....		2 01 24	2 30 24
Departure.....		2 06 39	2 35 39
Hera.....		Withdrew.	
Vaquero III.....		Withdrew.	
Mai.....		Withdrew.	

Wawa wins \$75, Musme \$50, and Asahi, sailed by Capt. Nat Watson, \$25.

New York Y. C. Fifty-first Annual Regatta.

NEW YORK—NEW YORK HARBOR.

Thursday, June 11.

THE New York Y. C. was in rare luck for its annual regatta on Thursday of last week. The day was simply perfect, clear, bright and bracing, with a rattling breeze from W.N.W., a most grateful change from the preceding days of fog and rain and raw easterly winds. Lander with his orchestra and Delmonico with his luncheon were aboard the steamer Taurus in fine racing form, fit to grace any regatta, and the club flag flew proudly over a fine fleet of yachts. Most of these, however, were of the would-be "protected cruiser" class, "tea-kettles," small and large. Of sailing yachts there were comparatively few and of racing yachts still fewer; in fact, the whole annual regatta resolved itself into a match between two yachts. Inter-esting as this was from the reputations of the two craft, the very successful Emerald and the well-known Colonia making her debut as a schooner, and close and exciting as the race was from start to finish, it made but a poor apology for the annual regatta which was once the great event of the season. Why the entry list was so small and the starters still fewer in number, and why but eight yachts finished, are hard questions to answer; but the result remains, that the regatta open only to club yachts and those of large size is a thing of the past. The conditions of Thursday were far above the average—ideal weather, a long and obstinate duel between two noted yachts, all of it plainly visible, and incidentally a view of the warships anchored off Staten Island and of a real yacht race; taking all of these together, the day was a success, but with such weather as on Wednesday, with-out Colonia, and without the merely incidental view of the 30-footers, it would have been a dismal failure.

The regatta was under the usual conditions, open to club yachts only, the courses being from off Buoy 13, outside the Narrows, down by the Ship Channel and Southwest Spit and out by the Hook; the larger yachts, all above 55ft. racing length, going around the Sandy Hook Lightship and home as they came, the smaller turning the Scotland Lightship and returning. The usual prizes were offered for both racing and cruising trim. In the absence of the three members of the regatta committee, Fleet Captain Griswold and Messrs. Tams and W. E. Iselin had charge for the day, accompanying Com. Brown on the steam yacht Sylvia. The entries were:

SECOND CLASS SCHOONERS—RACING TRIM.			
	Length.	Allows.	
Emerald, J. R. Maxwell.....	53.51	Allows.	
Colonia, C. A. Postley.....		Not meas.	
THIRD CLASS SCHOONERS—CRUISING TRIM.			
Iroquois, H. C. Rouse.....	83.28	Allows.	
Clytie, R. C. Ward.....	79.46	0 01 48	
FOURTH CLASS SCHOONERS—RACING TRIM.			
Amorita, W. G. Brokaw.....	74.82	Allows.	
Elsemarie, J. B. King.....	74.67	0 00 04	
FIFTH CLASS CUTTERS—CRUISING TRIM.			
Eclipse, L. J. Collonan.....	54.99	0 00 00	
Wasp, H. F. Lippitt.....	54.97	0 00 00	
SIXTH CLASS CUTTERS—RACING TRIM.			
Uvira, E. M. Lockwood.....	47.13	Allows.	
Norota, F. M. Hoyt.....	41.64	0 07 50	
SIXTH CLASS CUTTERS—CRUISING TRIM.			
Choctaw, J. M. Strong.....	47.08	Allows.	
Olga, C. P. Buchanan.....	34.76	0 20 00	
MIXED CLASS—RULE 4—CRUISING TRIM.			
Ramona, schooner, H. M. Gillig.....	105.84	Allows.	
Wayward, cutter, Duncan Elsworth.....	65.53	0 16 48	

At the last moment Amorita came down and Mr. Brokaw announced that the centerboard had jammed and that the yacht consequently would not start; she draws but 12ft. of water and consequently re-quires a centerboard to prevent leeway. The owner of the old sloop Eclipse, in spite of all he has done to improve her, not unnaturally had no desire merely to follow Wasp over the course and did not start. The "mixed" class, as prearranged, promised to be well worthy of its name, with the big old schooner Ramona matched against the cruising Burgess cutter Wayward, but unfortunately it was "spoiled" by the absence of Ramona. The committee wisely ex-ercised their discretion, and for once applied the rule to the purpose for which it was intended—of gathering up at the last possible mo-ment all the yachts that were without class competitors and making one class of them. This brought the two cutters Wayward and Wasp together, and made as good a race as was possible under the circum-stances. It turned out by no means interesting, as the two were minutes apart all day and the smaller won, by allowance; but it was better than a sail over for each.

Not only "wind and weather," but everything else permitted a

FOREST AND STREAM.

punctual start and the gun was not only fired promptly at 11, as per pro-gramme, but all of the yachts were at the line and ready for the start. The tide was running about half ebb and the wind was coming over the Staten Island hills in chunks, the water being smooth. After a ten-minute interval the starting gun for the smaller yachts was fired at 11:10:00, and Norota led the way over the line, the times being:

Norota.....	11 10 36	Olga.....	11 11 24
Uvira.....	11 10 43	Wayward.....	11 11 39
Wasp.....	11 10 53	Choctaw.....	11 12 26

Meanwhile the two big schooners were maneuvering up toward the Narrows, Colonia keeping to windward; they came down with a rush, Colonia carrying her No. 1 jibtopsail, while Emerald's stay was bare. Both carried clubtopsails. The first over the line was Iroquois, near the leeward end, where a white steam yacht barred her way, a most unnecessary proceeding where room was so plentiful. The times of the schooners were:

Iroquois.....	11 16 56	Elsemarie.....	11 20 17
Colonia.....	11 17 06	Clytie.....	11 21 45
Emerald.....	11 17 33		

The first incident of the day was the loss of Uvira's bowsprit when but a short distance from the line, compelling her to retire. The fleet went down the channel with a rush, Colonia soon being in the lead; the two were timed at the Spit, Colonia 11:50:00, Emerald 11:50:40. As both were timed from a moving vessel, the apparent gain of a few seconds for Emerald is not reliable, and only shows that the two had held about even on the reach of seven miles.

The wind was nearly astern after they had jibed over for the short leg out to Buoy 5 off the point of the Hook. Colonia got her spinnaker ready on the starboard side, setting it on the foremast. Emerald set hers a little later to port and on the mainmast. After passing the buoy they had the wind dead aft, so nearly so that they ran out to the mark on opposite jibes, as did the smaller yachts astern.

Which of the experts was right and which wrong was an open ques-tion. Emerald made a perceptible gain, and when she took in her spinnaker near the mark was on Colonia's lee-beam. On the other hand, while she had to take in her spinnaker boom to leeward and jibe over, Colonia merely had to trim down as she luffed around the Light-ship, she also being the inside boat. The result was that Colonia was timed with a lead of an even minute, instead of 27s, at starting. The approximate times at the Sandy Hook Lightship were:

Colonia.....	12 43 40	Iroquois.....	12 54 00
Emerald.....	12 44 40	Wasp.....	12 56 30
Wayward.....	12 50 00	Elsemarie.....	12 58 20

Once trimmed down, the pair on starboard tack, the fine work of the day commenced. Colonia swung a big clubtopsail, but it did not set properly. Emerald had her clubset over the jibheader, the tack started on both. The clubtopsail was not tacked down, and after about 15 min-utes on the wind she lowered it. There was no question between the two in carrying power; while Emerald came home without her club-topsail, and at times with the two working topsails clewed down, Co-lonia easily carried her clubtopsail, though she had it shaking much of the time, and gained little by it. She showed, however, ample power to carry her racing rig at all times.

The first development on the wind was the pointing of Emerald, very much higher than that of Colonia. At 12:51:00 Colonia went on port tack and crossed Emerald's bows, at once tacking again on her weather. At 12:55:00 Emerald went on port tack only to find Colonia to windward again. When she went about Colonia's foregaff fouled the springstay, and after holding along for a few minutes she went about and slacked her halyards to clear it, leaving Emerald free, she holding her port tack and soon lowering her clubtopsail. They parted now, on opposite tacks, and then both went about, coming together at about 1:10:00, when Emerald crossed Colonia's bows. To all appear-ances Colonia was doing better work on the port than on the starboard tack. She did not point with Emerald, and she was luffed up at times, presumably to set up halyards and sheets. They stood on toward the Highlands, Emerald now gaining, and at 1:40:00 both were close into the beach off Sandy Hook somewhere abreast of Spermaceti Cove. Colonia was to windward, and from the steamer it was a question whether Emerald could cross her when both had to tack for water. Colonia was drawing some 4ft. more water than Emerald, and this probably led her to tack first, at 1:47:00. Emerald held on until it seemed as though her bowsprit was somewhere in among the scrub cedars on the Hook, but at 1:50:00 she came about on port tack. The two now stood up along the beach until they could tack well clear of Buoy 5.

The wind had been much lighter outside the Hook all day, when the yachts passed the point, of the Hook and started to beat in to the Spit Buoy they felt the full force of it, and Emerald lowered both topsails to the caps. They were not closely timed at the Spit, but Emerald had a lead that meant a gain of over two minutes in the windward work.

Once around the buoys they had a close reach in, a fine bit of sail-ing for the spectators. Emerald heeled as the puffs caught her until she was far down on her beam ends. Colonia stuck to her clubtop-sail while the other was under lower sails, but she gained nothing by the big kite. She also carried a baby jibtopsail until the tack parted. Finally she parted the sheet of her foretopsail and took that in. While she gained on Emerald, especially when the latter rolled down almost flat, she failed to catch her. Just short of the line Elsemarie carried away the whole head of her jib. The official times were:

SECOND CLASS SCHOONERS—RACING TRIM.				
	Start.	Finish.	Elapsed.	Corrected.
Emerald.....	11 17 33	3 07 56	3 50 23	3 50 23
Colonia.....	11 17 06	3 09 04	3 51 58 *	Not meas.

THIRD CLASS SCHOONERS—CRUISING TRIM.				
Iroquois.....	11 16 56	3 26 29	4 19 33	4 10 33
Clytie.....	11 21 45	Withdrew.		

FOURTH CLASS SCHOONERS—RACING TRIM.				
Elsemarie.....	11 20 17	3 36 03	4 15 46	4 15 42

SIXTH CLASS CUTTERS—RACING TRIM.				
Norota.....	11 10 36	3 29 35	4 18 59	4 11 09

SIXTH CLASS CUTTERS—CRUISING TRIM.				
Choctaw.....	11 12 26	3 24 38	4 12 12	4 12 12

MIXED CLASS—CRUISING TRIM.				
Wasp.....	11 10 53	3 42 51	4 31 50	4 21 23

Colonia is not yet measured, but it is certain that she will allow time to Emerald; the latter wins a \$200 cup. Iroquois wins a \$100 cup; Norota wins a \$200 cup; Choctaw wins a \$200 cup and Wasp wins a \$100 cup in the mixed class.

The race between Colonia and Emerald, fine as were the conditions, cannot be taken as in any way conclusive. The older boat is in perfect racing form, the result of three seasons of thorough working up and successful racing. Colonia, on the other hand, is in nearly all re-spects a new boat, the rig, the ballasting and the centerboard being all new. She was hurried away from the yard only a day or two be-fore the race, with no time for trial, and is yet far from ready. The strong wind was also against her in this race, as sails and gear were not yet stretched to place. The showing under these circumstances promises some lively racing in the future meetings of the pair.

Corinthian Y. C., of Philadelphia.

ESSINGTON—DELAWARE RIVER.

Saturday, June 6.

THE fifth annual regatta of the Corinthian Y. C., of Philadelphia, was sailed on June 6, over a 20-mile course on the Delaware, starting from the club station at Essington. The times were:

The Ogdensburgh Y. C. Cup.

THE following announcement is made by the Ogdensburgh Y. C.: The Ogdensburgh Y. C. has offered a \$300 cup to be competed for by half-raters on July 28; the cup to be the personal property of owner of winning boat. The course will be an equilateral triangle, each side about one mile, in open water, clear of all headlands, and sailed under the rules of the Seawanhaka Corinthian Y. C. Mr. W. P. Stephens, yachting editor of the FOREST AND STREAM, has kindly con-sented to act as referee of this race. We have received assurance of entries from several Long Island Sound and Canadian yacht owners, and trust you can find it convenient to enter your boat. The N. Y. C. & H. R. R. C. have made a special rate from New York for this occasion, whereby half-raters can be loaded into large cars with end doors and shipped to Ogdensburgh and return by fast freight, at \$1.56 per 100lbs. each way, for actual weight. For instance, a boat weighing 300lbs., the charge for round trip would be \$9.36. We will be pleased to furnish entry blanks and any other information upon application to the secretary.

OGDENSBURGH YACHT CLUB, A. R. PORTE, Sec'y.

Douglaston Y. C. Annual Regatta.

DOUGLASTON—LONG ISLAND SOUND.

Saturday, June 18.

THE annual regatta of the Douglaston Y. C. was sailed on June 13 in a fresh breeze from N.E. which fell before the larger yachts had finished in the afternoon; the smaller craft had enough to make a very fine race.

Among the starters in the 15ft. class was Ideal, a new boat designed by W. P. Stephens for H. O. Havemeyer, Jr., and built by the Spald-ing-St. Lawrence Boat Co. She came down from the St. Lawrence by rail and was rigged and launched on Thursday afternoon. She is similar to Ethelwynn, but with 2in. more beam and a larger sail plan. She is very handsomely finished, the deck of Spanish cedar and the topsides in white enamel. Her rig is similar to Ethelwynn, with silk sails by Wilson & Griffin. The courses were:

Classes 1, 2 and 3, from line between the club house and a stakeboat anchored in Little Neck Bay around Gangway buoy, to be left on starboard hand; thence to starting line, leaving stakeboat on port hand; thence to Gangway buoy, leaving it on starboard hand; thence to starting point, stakeboat on starboard hand; about 20 miles.

Class 5, from a line between the club house and a stakeboat an-chor-ed in Little Neck Bay, around Gangway Buoy, to be left on star-board hand to starting point, leaving stakeboat on port hand, around a stakeboat anchored in Pelham Bay, opposite Stepping Stone Light, leaving it on Starboard hand, to starting point, stakeboat on star-board hand. About fifteen miles.

Classes 9, 10, 11, 12, 13, from a line between the club house and a stakeboat anchored in Little Neck Bay, around a stakeboat anchored N. E. of Throgg's Neck, around a stakeboat anchored in Pelham Bay, opposite Stepping Stone Light, both marks to be left on the starboard hand, thence to the starting point, stakeboat on port hand, thence around the stakeboat in Pelham Bay, thence to starting point, leav-ing both stakeboats on starboard hand.

The Douglaston Y. C. is fortunate in the possession of a cozy float-ing house, which lies through the season in Douglaston Bay, but which on occasions like this is towed out to the mouth of Little Neck Bay, at the head of the racing courses. From the house the courses for the smaller yachts were plainly visible, though the steam yacht, Belle Haxen, Com. Hoyt, carried the committee and guests over the inner course. The race of the large yachts, around the Gangway Buoy, was visible only in part.

The regatta was under the rules of the Y. R. U., with a one-gun start in all classes. The first gun was fired at 12:30, and the start for Class 3 at 12:30, Coya going over promptly, with Ellide on her weather quarter. The next class started at 12:35, Oconee over first, followed by Molly Bawn to windward of Exonian. They all trimmed close for the reach across to the Stepping Stones. Molly Bawn held a good wind and worked well out from the start. The catboats started at 12:40, Mary II. going over on the gun, followed by Caper, Violet, Baby, Melita. The 21-footers and 15-footers started at 12:45, Ideal, with a single reef in, making the best start, followed by Olita, Celia, Houri, Paprika, Hope, Ulmec, Question. These and the cats in Classes 11, 12 and 13 had an easy reach across wind and tide, the latter running to windward, to the Throgg's Neck Buoy, a little over a mile; then about a mile and a half of windward work to the City Island mark; and then three legs of reaching across the Sound and back, so that the race was nearly all a reach. Mary II. held her lead to the first mark, the fleet being remarkably well bunched when the small size of some of the boats is considered; the little Paprika made a close race across with the 21-footer Celia. The order of the 15-footers was Paprika, Ulmec, Hope, Olita, Question and Ideal. All but the new boat had started with whole sail, and after coming on the wind she shook out her reef.

While Mary held out toward the channel on port tack, Presto stood in nearer the Pelham shore, and at the end of the windward leg was far ahead. Paprika improved her position on the fleet of 15-footers to windward, and did still better when she started sheet for the free reach to the line. Hope was about a minute astern of her, and Ulmec third, the others well strung out astern. Near the end of the round Ideal passed Olita and left the latter at the tail. The order of the turn was: Presto, Houri, Oconee, Punch, Molly Bawn, Celia, Mary, Paprika, Hope, Ulmec, Question, Ideal and Olita. On the way across to the City Island mark, Mary lowered her mainsail and withdrew. Going out and back Paprika gained considerably, Ulmec picked up and passed Hope, and Ideal passed Question. Houri, with a new suit of Wilson & Griffin sails of very light material, easily left Celia. The official times were:

CLASS 3—SLOOPS, CUTTERS AND YAWLS, 30 TO 36FT.—START 12:30.				
	Start.	Finish.	Elapsed.	Corrected.
Mignon, Joseph Fournier.....		4 07 35		
Coya, Wm. Grace.....		4 19 45		
Ellide, W. W. Hollingsworth.....		4 29 55

Mollie Bawn, F. M. Brown.....		3 04 50		
Oconee, C. T. Pierce.....		3 14 40		
Exonian, W. R. Fleming.....		Withdrew		

CLASS 9—15 FOOTERS—START 12:45.				
Olita, H. C. Rouse.....		2 33 31		
Question, L. D. Huntington.....		2 33 30		
Hope, Arthur Iselin.....		2 39 50		
Paprika, C. S. Hoyt.....		2 34 10		
Ulmec, W. W. Howard.....		2 37 00		
Ideal, H. O. Havemeyer, Jr.....		2 32 15		

CLASS 10—21-FOOTERS—START 12:45.				
Houri, E. Burton Hart, Jr.....		2 18 00		
Celia, W. F. Gould.....		2 20 35		

CLASS 11—CABIN CATS, UNDER 22FT.—START 12:40.				
Presto, F. M. Randall.....		2 17 30		
Mary II., W. E. Elsworth.....		Withdrew.		
Caper, Edward G. Unitt.....		Withdrew.		
Melita, O. H. Chelborg.....		3 40 50		

CLASS 12—OPEN CATS, 22FT. AND UNDER—START 12:40.				
Punch, A. Clark.....		2 32 00		
Violet, G. A. S. Wieners.....		2 37 40		

CLASS 13—OPEN CATS, BETWEEN 20 AND 25FT.—START 12:40.				
Baby, D. A. Corry.....		2 34 00		

The winners are: Mignon, Mollie Bawn, Paprika, Ulmec (second prize), Houri, Punch and Baby. Presto is a new cabin cat, designed and built by the Crosby Co., of Bay Ridge. After the race the club house was towed back to its moorings and the members and their guests spent the evening in dancing.

San Francisco Corinthian Y. C. Annual Regatta.

SAN FRANCISCO BAY.

Saturday, May 30.

THE annual regatta of the Corinthian Y. C. of San Francisco was sailed in a strong breeze on May 30, the times being:

Meteor III.

MAKING all due allowance for the enthusiasm which always greets a new yacht of the largest class, especially when owned by a millionaire or even by royalty, it nevertheless appears that Mr. Watson has distinguished himself in his latest production, and that she is a remarkably fast yacht. Just how fast it is difficult yet to say, as she is being tried by a new standard that is very imperfectly understood by yachtsmen. As quoted below from the *Field*, with some 2,000 ft. more sail she measures by the new rule but little more than the old rating yachts of the class. The *Field* describes her as follows:

"On leaving the dock at Southampton, the German Emperor's Meteor sailed for Cowes, whither sundry fittings had been forwarded from the Clyde. In the small hours of Wednesday morning she arrived at Tilbury, where she took up a berth near Satanita, completely dwarfing such, by comparison, small fry as Caross and The Saint, wedged in between the two giants. Like her predecessors, the new Meteor's topsides are painted dark blue, which, if anything, deludes the eye into an exaggerated estimate of her by no means diminutive proportions. The rumor that she is fitted with a wheel forward of the mast is without foundation. She has, indeed, a detachable wheel for cruising purposes, but when in use it merely takes the place of the filler, the compass in that case being shifted to a skylight further aft. Her round steel boom appears to be shorter than the octagonal boom of Valkyrie III., and certainly gives the impression of great strength. Her topsail halyards are brought down below the deck and made fast to the hoisted portion of the mast in the forecabin. This part of the vessel is lit up by a couple of large hatches, one forward and one abaft the mast. It contains three rows of folding bunks, while on the starboard side a snug little cabin is partitioned off for the use of her skipper, Gomes.

For the bulkheads throughout the whole of the vessel—excepting of course in the forecabin—light woods and a flowered cretonne have been used, which has the effect of making the interior appear very roomy and airy. The saloon is most tastefully upholstered in dark green leather, with the imperial crown and the motto of the garter stamped in gold. Two swing tables are placed in front of the two orthodox couches, of which the one on the port side has been docked to allow space for a small escritoire. The three cabins, which follow aft, are commodious and light apartments and fitted with wide bunks. Right aft is the ladies' cabin, across the whole width of the vessel. The space opposite the foot of the companion is fitted with a comfortable lounge, while a number of small closets, cupboards and a separate bath-room lead out of the passage. At present the cabins are occupied by Lord Lonsdale, Mr. R. Allan and Capt. Arendhold, of which the last named, a retired naval officer and marine painter of no mean talent, will be remembered as having last year had command of the Emperor's 20-rater Vireta. Lord Lonsdale's sturdy little ocean-going steam launch Sybil, fitted with a powerful search-light forward of the funnel, is in attendance on the Meteor. The large cutter will leave shortly for the Elbe, whence she proceeds by the Kaiser Wilhelm Canal to Kiel for the racing on the Baltic. She will return in the early part of July and compete in the different regattas with the large class. According to present arrangements, the German Emperor will not come to Cowes for the regattas.

It is a very wonderful provision of the new rating rule that the Meteor can have 2,000 sq. ft. more canvas than Britannia and Satanita, and 1,400 sq. ft. than Ailsa, and yet only rate 101.1, or possibly 101.2. This is bringing in the old length class type with a very heavy vengeance indeed; practically the tax on sail has been wiped out, at any rate as far as the large class is concerned.

Her dimensions, as quoted by the same authority, are: l.w.l. 89ft., beam 24ft. 3in., draft about 17ft., boom 59ft., sail area about 12,240sq. ft.

The regatta of the Royal Cinque Ports Y. C. was sailed off Dover on June 6; Britannia, Ailsa, Meteor and Satanita starting in the order named at 11:30 A. M., with a light southwest wind. The course was about fifty miles. The Saint, The Penitent and Niagara started at noon, in the order given.

Up to 12:30 P. M. only the faintest airs had assisted the racers, but Meteor had stolen away to the westward and was about a mile ahead of Satanita, only these two yachts having succeeded in weathering the pier end. Britannia and Ailsa, farther out in the channel, were obliged to anchor in order to prevent the tide from driving them away. In the 52ft. class, at the same hour, The Saint had a long lead on Niagara. The Penitent was badly handicapped. Fifty minutes elapsed before she crossed the line and went in chase of her opponents.

The course for the large yachts is to Boulogne-sur-Mer and back, and the course for the smaller yachts was originally twenty-four miles, but owing to the paltry wind the distance was reduced to twelve miles.

Niagara crossed the finish line at 5 hours 10 minutes and 48 seconds—nine minutes ahead of The Saint and eleven minutes before The Penitent. Meteor won the race for the large yachts, with Britannia second.

The regatta of the Royal Southampton Y. C. was sailed on June 11, and resulted in another victory for Meteor. The weather conditions were not favorable to a speedy race, but Meteor sustained her reputation of being the best boat in soft winds.

At the time of the start, which was made at 10:45, the wind was very light. As soon as Meteor was fairly started she began to gain on Hester and soon passed her.

The boats were timed when they passed Calshot, and Meteor was then two minutes ahead of Britannia. Hester and Ailsa were in the rear of the Prince of Wales's cutter, while Satanita, after being recalled at the start, was fifteen minutes astern of the leader and practically out of the race. Meteor continued to gain slowly but surely, and the next time a watch was put on the boats she was fifteen minutes ahead of Britannia.

A little while afterward the yachts were in the doldrums and the race became wearisome. They drifted with the tide and in this Meteor proved herself the best boat of the lot. Satanita, seeing there was no possible chance for her, gave up the race. Hour after hour passed, with occasionally little puffs of wind, of which full advantage was taken, and it was not until 7h. 52m. 50s. that Meteor went over the finish line. Britannia was second at 8h. 18m. 30s., and Ailsa third at 8h. 19m. 20s. The only feature of the race was Meteor's wonderful performance despite the almost complete absence of wind.

The 20-raters Niagara, Audrey and The Penitent also raced over the Brambles course, a distance of thirty-two miles. The Penitent won, with Audrey second and Niagara last.

On June 13 Britannia, Meteor, Ailsa, Satanita and Hester started in the race for any yachts exceeding 39 rating, under the auspices of the Royal Southern Y. C., for prizes of £60 to the winner and £20 to the second. The course was around the Calshot Spit Lightship to East Lepe and East Sturbridge Buoys, back to the West Brambles Buoy, and thence to the starting line, twice around, a distance of forty-five miles.

The weather was fine and a whole sail breeze was blowing from the southeast when the starting gun was fired. The boats got away well together, the times at the start being:

Satanita.....	10 30 15	Hester.....	10 30 50
Ailsa.....	10 30 30	Meteor.....	10 31 03
Britannia.....	10 30 34		

It was a beat to the Calshot Spit Lightship and then a reach on the port tack to the East Lepe Buoy, at which point the times of the boats were taken as follows:

Satanita.....	11 02 10	Meteor.....	11 05 03
Ailsa.....	11 03 04	Hester.....	11 08 20
Britannia.....	11 04 36		

Passing Cowes the times were:

Satanita.....	11 20 00	Meteor.....	11 24 47
Ailsa.....	11 21 45	Hester.....	11 31 50
Britannia.....	11 24 10		

Before reaching Old Castle Point Meteor got to windward of Britannia and passed her. Later Meteor went ashore, but remained fast only a few minutes. After floating she continued in the race. Shortly after the yachts had passed Cowes the wind changed and headed the boats, and they beat across Osborne Bay. The race was stopped at the end of the first round. The yachts finished as follows:

Meteor.....	2 47 50	Satanita.....	2 55 12
Britannia.....	2 49 04		

Britannia won on time allowance.

The wind fell off in the afternoon. The twenty-raters went over the course prescribed for them. The Saint finished first, the Audrey second and The Penitent third. Mr. Howard Gould's yacht Niagara has been docked and consequently did not sail in the race.

In the Royal Southern regatta on June 12 the 52-footers, The Saint, The Penitent, Audrey and Niagara started at 10:30 A. M. At the conclusion of the first round the yachts held the positions in the order named: The Saint won, and The Penitent was second. The times of finish were as follows: The Saint, 4h. 20m. 30s.; The Penitent, 4h. 22m. 31s.; Audrey, 4h. 30m. 36s.; and Niagara, 4h. 32m. 41s.

The Orillia Yacht and Canoe Club was formed at Orillia, Ontario, last week with the following officers: Com., Thomas H. Sheppard; Vice-Com., George Curran; Sec.-Treas., E. W. Strathy. Mr. Andrew Falt has generously given the club the free use of his magnificent club house at the lake side, and Com. Sheppard has donated a \$50 challenge cup, which will be competed for for the first time on Dominion Day, July 1.

CHART OF COURSES FOR SEAWANHAKA TRIAL AND CUP RACES, OFF OYSTER BAY, LONG ISLAND.

Seawanhaka C. Y. C. Trial Races.

ON Monday next, June 22, the trial races of the Seawanhaka Corinthian Y. C. for the selection of a defender for its international cup begin at Oyster Bay, continuing on the two following days. The following conditions governing both the trial and cup races were published early in the season, but in answer to many inquiries we repeat them:

GENERAL REGULATIONS GOVERNING THE MATCH AND TRIAL RACES FOR 1896.

- I. The courses shall be on the waters of Long Island Sound in the vicinity of Oyster Bay or in the bay itself. They shall consist of a triangular course and a course to windward or leeward and return. For the 15ft. class, each leg of the triangular course shall be two nautical miles in length and shall be sailed over twice, making a total of twelve miles. The course to windward or leeward and return shall be three nautical miles to each leg and shall be sailed over twice, making a total of twelve miles.
- II. The start shall be a one-gun flying start.
- III. The races shall be sailed without time allowance.
- IV. Yachts must not exceed 15ft. racing length (S. C. Y. C. measurement).
- The formula for determining racing length under the S. C. Y. C. rules is as follows:
$$\frac{L \times W \times L + \sqrt{\text{Sail Area}}}{2} = \text{Racing Length.}$$
- V. Yachts shall be measured without crew on board, but instead thereof a weight of 300lbs. shall be carried amidships during measurement to represent crew.
- VI. All ballast shall be fixed. (Weighted centerboards shall be considered fixed ballast.)
- VII. No outrigger or other mechanical device for carrying live ballast outboard shall be allowed.
- VIII. In determining sail area a system of measurement shall be employed which will give, as nearly as possible, the actual number of square feet thereof. Sails shall be limited to mainsail, jibs and spinnaker. The combined area of mainsail and of the jib used in windward work shall constitute the factor of sail area in determining racing length. The area of spinnaker and balloon jib shall each be limited to four-tenths of the total area of the mainsail and jib used in windward work.
- IX. The helmsman shall be an amateur, and the total number of persons on board shall be limited to two.

The race committee also announce the following programme for the trial races, subject to change, of which due announcement will be given:

TRIAL RACES TO SELECT THE DEFENDER FOR THE YEAR 1896 OF THE SEAWANHAKA INTERNATIONAL CHALLENGE CUP FOR SMALL YACHTS, JUNE 22, 23, 24.

- Courses.—1. The course for the first and third trial races shall be triangular and shall be as follows:
- Triangular Course.—From a line between Center Island Buoy off the entrance to Oyster Bay, Long Island Sound, and the committee steamer anchored S.E. of the same.
- E. by N. $\frac{1}{2}$ N.—Two miles around a mark bearing a red flag or ball, leaving it on the port hand.
- N.W.—Two miles around a mark bearing a red flag or ball, leaving it on the port hand.
- S. by W. $\frac{1}{2}$ W.—Two miles across finish line between Center Island Buoy and the committee steamer anchored N.W. of the same.
- Course to be sailed over twice; total distance twelve nautical miles. On the second round yachts will leave Center Island Buoy on the port hand.
- Note.—The race committee may in their discretion direct the course to be sailed in the reverse direction, leaving buoy and marks on the starboard hand, and the signal for such reversal of course will be the anchoring of the committee steamer at the start to the N.W. of Center Island Buoy. In this case the committee steamer will be anchored S.E. of Center Island Buoy at the finish.
2. The course for the second trial race shall be a course to windward or leeward and return.
- Course to Windward or Leeward and Return.—From a line between Center Island Buoy and the committee steamer around a mark bearing a red flag or ball, leaving it on the starboard hand; distance 3 miles and return; course to be sailed over twice; total distance 12 nautical miles. The direction will be signalled by the general yacht signal code from the committee steamer at least 15 minutes before the preparatory signal.
- Start and Signals.—The start will be a one-gun flying start with a preparatory signal, and will be made at 12 o'clock noon across a line between Center Island Buoy and the committee steamer.
- First Signal.—Preparatory (whistle 15 seconds long). The club

burgee on the committee steamer will be lowered and a blue peter hoisted.

There will be an interval of 5 minutes between the first and second signals.

Second Signal.—Start (whistle 15 seconds long). The blue peter will be lowered and a red ball hoisted.

Note.—Attention is called to the fact that the flags and balls constitute the signals, the whistles merely calling attention thereto.

Special Conditions.—1. The yacht selected to defend the cup shall be the one which, in the judgment of the race committee, shall be the best adapted therefor, and not necessarily the winner of a majority of the trial races. Additional races may be ordered by the committee between such contestants as they may select.

2. The owner of each yacht entering for the trial races must on or before June 20 furnish to the secretary of the committee the racing measurement of his yacht certified by the measurer of the S. C. Y. C.

3. Each yacht must carry a racing number (which may be obtained at the club house on the morning of the first race) fastened securely on both sides of the mainsail.

4. In the event of a race being postponed or ordered resailed, it will be sailed at as early a date as may be practicable.

Entries.—All entries for the trial races must be made by the clubs to which the owners of the respective yachts entered belong. Clubs intending to make entries are requested to notify the secretary of the race committee and will be furnished with printed or written blanks upon or in accordance with which entries must be made, and at the request and upon the responsibility of any club entering a yacht to compete in the trial races, all the privileges of the club house at Oyster Bay will be extended to the owners and amateur crew of the yacht so entered during the period occupied by the said races, upon the same terms as to members of the club.

OLIVER E. CROMWELL, Chairman,
64 Leonard street, N. Y.
CHARLES W. Wetmore,
35 Wall street, N. Y.
WALTER C. KERR,
26 Cortlandt street, N. Y.
D. LEROY DRESSER,
55 White street, N. Y.
CHARLES A. SHERMAN, Secretary,
64 Leonard street, N. Y.

Race Committee.

The club measurer, Mr. Hyslop, will be on hand to measure the yachts, but it is quite probable that there may not be time to measure all before the races. Yachts may be entered upon the certificate of measurement of the clubs to which they belong, subject to verification or remeasurement at the option of the committee or upon protest.

In one of the circulars sent out a misprint of dates of the cup races occurs, the correct dates being July 13 and succeeding days.

Racing numbers may be had, at a cost of 25 cents per set, of Rehm & Co., 157 Fulton street, New York.

Columbia Y. C. Annual Regatta.

NEW YORK—HUDSON RIVER.

Thursday, June 11.

THE Columbia Y. C. sailed its annual regatta on June 11 in a strong westerly wind, the course being a triangle on the Hudson from off the club house, Eighty-sixth street, New York, across the river to a stakeboat off Fort Lee, then down to a stakeboat off Guttenberg and home, two rounds making 15 miles. The times were:

Atlantic Y. C. Special Races.

BAY RIDGE—NEW YORK BAY.

Saturday, June 13.

The Atlantic Y. C., under its present energetic officers, has joined the procession of live racing clubs and inaugurated a series of weekly races for the smaller classes, in addition to the stereotyped fixtures of an annual regatta and annual cruise. Whether it is a good policy at the present day to close these smaller events to the yachts of sister clubs is an open question; in our opinion the club would profit by a more liberal policy, such as is now the rule.

The race of Saturday was for three sets of prizes: the handsome Washington cup, presented by Allan O. Washington for the new 30ft. special class; the two Adams cups, presented by Vice-Com. Adams, the first legs for which were won on June 6 by Choctaw and Step Lively; and the club prizes of \$25 in several of the regular classes, the winners of the Adams cups being barred from these prizes. The courses were two triangles, each sailed three times, the starting and finishing lines being off the club house at Bay Ridge. The larger yachts sailed first past the Bay Ridge Bell Buoy, then past the Robbins Reef Bell Buoy, then past Buoy 14 and home; the catboats sailed the same course, omitting the Robbins Reef Buoy. The distances were 13½ and 10 miles. The wind was light from S.E., making a reach to the first mark, a run up the Bay, and a beat in from Buoy 14 to the line on each round. The entries were: For the Washington cup—Wawa, James Stillman; Esperanza, A. S. Van Winkle; Departure, C. Barnum Seeley; Hera, Ralph N. Ellis; Mai, O. G. Jennings; Vaquero III, H. B. Duryea; Argonaut, J. R. Maxwell; Caroline, Pembroke Jones; Musme, J. M. Macdonough. For the Adams cups and club prizes—Sloops, cutters and yawls: Penguin, Geo. E. Brighton; Swannanoa, Stephen Loines; Tigress, James Weir, Jr.; Lynx, R. B. Lynch; Wabossa, H. B. Shaen; Choctaw, J. M. Strong; Sultan (yawl), John H. Cromwell. Cabin cats: Streak, C. H. Lary; Squaw, H. S. Jewell; Ethel, F. M. Randall. Main-sail yachts: Presto, F. M. Randall; Step Lively, F. M. Randall.

The new 30-footer Argonaut, designed by Winttingham for J. R. Maxwell, was unable to start owing to some delay in fitting out; there was, however, another new Herreshoff boat present, Caroline.

The start of the 30ft. class was made at 2:55, Mai, steered by L. D. Huntington, going over first. Mai and Asahi made a hot race, the latter finishing first, but being protested by Mai for fouling her at the Robbins Reef Buoy on the first round. The protest will be heard by the regatta committee. The times were:

30FT. CLASS—START 2:55:00.

The ownership of the Washington prize is as yet undecided. Acushla was first in the general race and wins \$25; she was barred for the Adams cups, not having started in the first race. Choctaw wins one Adams cup and Step Lively the other, each having won a leg on June 6. The club prizes go to Tigress, Acushla and Iris. The house was open to ladies during the afternoon, and in the evening a special entertainment took place under the direction of Prof. Hermann, of the steam yacht Fra Diavolo.

Hudson River Y. C. Annual Regatta.

NEW YORK—HUDSON RIVER.

Saturday, June 13.

The annual regatta of the Hudson River Y. C. was sailed on June 13 over the club's triangular course on the Hudson. The race started in a fresh N.E. breeze, but it soon fell and but a few of the fleet drifted home. The times were:

FIXTURES.

JULY.

1-8. Atlantic Division Meet, Lake Hopatcong, N. J.

Atlantic Division Meet.

LAKE HOPATCONG, JULY 1-8.

The annual camp of the Atlantic Division will be held on Lake Hopatcong during the week July 1 to 8. The site chosen commands a splendid outlook over the western portion of the lake, is well removed from cottages and hotels and is situated on the point between Henderson Bay and Henderson Cove, just opposite the northern end of Chincopee Bridge, which separates Raccoon Island from the mainland.

The arrangements for the camp will comprise the furnishing of skids, tent floors—if desired—straw for tents, flag poles and ice at cost. Fire wood for fuel and camp-fires is abundant and the water off the point is deep and cool and all that could be desired for drinking purposes. The prevailing winds on the lake will sweep the camp, and malaria and mosquitoes are said to be unknown. Storage tents for duffle, etc., pending the arrival of owners, and for the use of members arriving unexpectedly, will be provided.

The scheme for transportation from New York and vicinity (if the estimated attendance warrants it) is a canal boat which will make the rounds of the club houses from Yonkers to Gravesend Bay, thence to the Passaic River and thence up the canal and into the lake. The boat will be retained during the camp and will serve not only as a "Home for the Friendless," but also for the delivery of duffle and canoes at the close of the camp. Members from along the Delaware can ship either by car direct to the lake or by lighter to New York; their canoes and duffle to be transferred to the canal boat at Jersey City. If the attendance does not warrant the use of a canal boat, canoes and duffle can be shipped to Hoboken or Communipaw, and thence by freight or members can procure individual transportation to the lake by regu-

lar canal boats should they so desire. Local transportation on the lake is all that could be desired. Two lines of swift launches ply at all hours, and will stop at the camp on every trip. Members can come by rail via the D. L. & W. R. R. to Hopatcong, or via the C. R. R. of N. J. to Lake Hopatcong (Nolan's Point). The launches meet all trains.

The question of a general mess cannot be well considered until a fair estimate is made of the probable attendance. Should the number warrant it, the proprietor of the Hollywood Hotel, on Raccoon Island, across the bay from the camp, has agreed to run a good and substantial mess at the camp for the use of the members at a reasonable charge per day. Otherwise the members can paddle about one-third of a mile across to Raccoon Island and walk to the hotel, where a separate room for meals will be provided for the members from the camp and their friends. The various clubs can also furnish club messes or members can cook for themselves. For the latter there is the benefit of a first-class store, well stocked, on Raccoon Island, where supplies and provisions can be ordered and delivered by launch.

The regatta committee has under way the programme for the races, for which several trophies and prizes have already been given and others promised.

In the firm belief that the strength and success of the American Canoe Association depends upon the interest and energy manifested by its several divisions, the executive and subcommittees heartily urge upon you to attend the camp, and thereby contribute not only to the pleasure of your summer outing, but to the entire success of the camp, and the satisfaction of your committees.

Please respond at your earliest opportunity on the inclosed card, whether your presence can be reckoned on, and for how long, and further advice respecting the exact cost of transportation for yourself, and for your canoe and duffle, programme of the races, and general information as to the mess, camp accommodation, etc., will be sent you at an early date.

Camp Site Committee: William C. Lawrence, Rear-Commodore, chairman; Joseph Edward Murray, Leavitt H. Cawley.

Regatta Committee: Henry H. Smythe, chairman; H. Lansing Quick, John M. Hamilton.

Transportation Committee: Percy F. Hogan, chairman; E. M. Underhill, James K. Hand.

JAMES K. HAND, Vice-Commodore.

Susquehanna River.

A CORRESPONDENT desiring to cruise on the Susquehanna River writes as follows; possibly some of our readers may be able to aid him:

1. At what point would you advise entering the river, so as to get the best canoeing and scenery?
2. How long will it take to go from Ninevah, New York State, to Sunbury, Pennsylvania, traveling not over six to eight hours a day?
3. What are the best points along the route at which to stop for meals?
4. Are there any dangerous places in the route to be avoided?

Housatonic River.

A CORRESPONDENT is desirous of obtaining information concerning the Housatonic River.

CANOEING NEWS NOTES.

The spring regatta of the Red Dragon C. C. will be held on June 20, off the club house, Wissinoming, Philadelphia.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Upper Mississippi Schuetzenfest.

WINONA, June 8.—The twenty-fifth annual tournament of the Upper Mississippi Schuetzenfest closed Sunday with the crowning of the Schuetzenkönig, A. J. Vandusen, of Winona, at the club's park. The fest has been running since Thursday. Sharpshooters from Milwaukee; Joliet and Peoria, Ill.; Davenport, Lyons and Dubuque, Ia.; La Crosse and other Wisconsin and Minnesota cities were present. In the team shoot Milwaukee won with 999, La Crosse 981, Davenport 974, Joliet 969, Winona (first team) 956, Sugar Loaf 924, Fountain City 903, Winona (second team) 887. A. J. Vandusen, of Winona, made 53 bullseyes in the team shoot, with Geo. Ziegenfuss second, 41. In the king shoot A. J. Vandusen broke the world's record with 371 red flag, tying and beating F. C. Ross's New York record made in 1895; blue flag, Amel Berg, of Davenport, Ia., second. The prizes were very fine and were valued at \$1,500. The cash prizes amounted to \$1,200. On the o targets Berg won the standard, 47; honor, J. C. Haymes, of Lyon, Ia., \$100; man, Berg 95; people's, A. J. Vandusen 72. The Winona ocoys have the finest range in the West. The next tournament will be held at La Crosse. F. J. S.

Rifle Club Constitutions.

We would be obliged if secretaries of rifle clubs would favor us with copies of constitutions and shooting rules, that we may send them to other clubs seeking such information.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

June 18-20.—SPOKANE, Wash.—Twelfth annual tournament of the Sportsman's Association of the Northwest, under the auspices of the Spokane Rod and Gun Club. H. Bolster, Sec'y of Association.

June 23-26.—PITTSBURG, Pa.—Tournament of the Pittsburgh Gun Club; targets; \$500 added money.

June 25-26.—HOLLAND, Mich.—Tournament of Michigan Trap-Shooters' League, on grounds of Holland Gun Club. Inanimate targets. Open to all. A. Harrington, Sec'y.

July 4.—SPRINGFIELD, N. J.—Annual tournament of the Union Gun Club; live birds and targets. E. D. Miller, Sec'y.

July 4.—PLEASANT HILL, Mo.—All-day shoot of the Pleasant Hill Gun Club.

July 4.—GREGORY'S POINT, Conn.—All-day shoot of the Naromake Gun Club. Targets. W. E. L. Capron, Sec'y.

July 21-22.—HOT SPRINGS, Ark.—Sixth annual meeting and tournament of the Arkansas State Sportsmen's Association; \$165 added money. All purses divided on equitable system. John J. Sumpter, Jr., Sec'y, Box 111, Hot Springs, Ark.

July 22-23.—PORTLAND, Me.—Interstate Association's tournament, under the auspices of the Portland Gun Club.

July 30, 31.—GOSHEN, Ind.—Midsummer tournament of the Goshen Gun Club.

Aug. 4-5.—CHICAGO, Ill.—Tournament of the Du Pont Smokeless Powder Company. E. S. Rice, Mgr.

Aug. 11-14.—DETROIT, Mich.—Jack Parker's sixth annual international tournament. Fuller details later.

Aug. 26-27.—BURLINGTON, Vt.—Tournament of the Interstate Association, under the auspices of the Lake Side Rod and Gun Club.

Sept. 7.—MARION, N. J.—Sixth annual tournament of the Endeavor Gun Club. Targets. J. A. Creveling, Sec'y.

Sept. 8-11.—HARRISBURG, Pa.—Annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Harrisburg Shooting Association.

Sept. 15-16.—KANSAS CITY, Mo.—Third annual tournament of the Schmelzer Arms Company; \$750 added money.

Oct. 7-9.—NEWBURGH, N. Y.—Annual fall tournament of the West Newburgh Gun and Rifle Association; targets and live birds; added money announced later.

October (second week).—BALTIMORE, Md.—Baltimore claims this week for her tournament. Dr. Samuel J. Fort, Sec'y.

1897.

March 23-25.—NEW YORK CITY.—The Interstate Association's fifth annual Grand American Handicap at live birds.

Handicaps and Highest Possibles.

In all branches of sport there is no form of contest that is more popular than a handicap race. Races of any kind where everybody starts from scratch never have the number of entries that a handicap event will have. Possible exceptions to this rule might be events where a considerable amount of money was added to the stakes; but the rule goes that whenever you want a large entry list a handicap of some sort is required.

Horse racing, foot racing, yachting, bicycling, etc., all have their handicap events. Were it not so in horse racing Hastings, Hand-spring, Clifford, etc., the crackerjacks of the turf, would clean up everything with as much ease as the crackerjacks of the shotgun carry off the bulk of the money at every tournament. The Audubon Gun Club, of Buffalo, N. Y., realized the necessity of encouraging the "amateur" at the recent New York State shoot and imposed a stiff handicap upon "known experts." The result, we think, was satisfactory to the majority, who felt that they were being given a show for "their white alley." Fully appreciating, as we do, the difficulties of the club's situation when tackling the question of imposing a handicap, we think a mistake was made in regard to the 50-target events. The rule adopted by the club was that experts must shoot into first or second place or else be out of the money. That is all right so far as 20-target events go, and we think that experts have no right to kick at that handicap; they'll get into money often enough to more than bring them even, if they shoot up to their gait.

But take a 25-target race; Where there are 50 to 60 entries, no unusual number nowadays, there is almost sure to be a straight score made. Experts, therefore, must break 25 or 24, or else be out of the money, and 24 out of 25 is a 96 per cent. clip! For that reason we would urge that in all 25-target events where a similar system of handicap is imposed experts must shoot into first, second or third place to be in for the money. In 50-target events we would suggest that experts must break 46 or better to get in for money. That would make the game hard enough to suit the rank and file, and yet give the experts a good show.

There is another form of handicapping that has great possibilities before it, if some of the mistakes that now exist in the system are eradicated in time. We refer to 50-target and 100-target handicap events, with allowances of extra targets to shoot at. We cannot call to mind just now any sport in which it is easier to "rope" or conceal from than it is in trap-shooting. Again a man is liable to go clean off in his shooting in one event and then break straight in the next. Handicap events with allowances of extra targets are therefore most uncertain affairs, and no matter how careful a handicapping committee may be, there is always sure to be a few unpleasant remarks made after it is all over. Personally we have assisted in fixing the handicaps in several 100-target events, so that we can speak with some degree of authority as to the anxieties and the unpleasantness attached to the duties of a handicap committee. It is only natural, therefore, that we should have looked round for some way to minimize those anxieties and that unpleasantness; and we think that in the following suggestions we have evolved something that may tend to help out handicap committees and to make such events as the above still more popular:

- (i) All target handicap events to be high guns.
- (ii) The handicap committee to fix a highest possible; the said highest possible to be a certain percentage below 100 per cent.
- (iii) All ties to be shot off at ten targets per man.

In defense of (i): We would point out that the semi-expert and the amateur have their advantages in their handicap allowances; "high guns," therefore, does not injure their chances as much as it would if the event was a scratch one. There is also no dropping for place in "high guns."

Next as to (ii): In 50-target handicap events make the highest possible score 47 (or 48), beyond which no targets broke can be scored; in 100-target events make the highest possible 94 (or 93). To each of these rules should be added the following exception: "Unless a scratch man shall break more than 47 (or 48) in a 50-target race, or more than 94 (or 93) in a 100-target race; in such cases that scratch man's score to be the highest possible. The above rule imposes no impossibility on a scratch man or on a man with a small allowance, and is, we think, absolutely fair to all.

As to (iii): On the shoot-off of ties there would be no handicap; each shooter has had his chance in the original race, and by limiting the number of targets to 10 everybody has about an equal show. If a division was agreed upon there need be no shoot-off.

The number of high guns in a handicap event of the above nature should be regulated by the number of entries, as was done so successfully in the Grand American Handicap of 1896. Thus there might be one additional money for every 4 or 5 shooters over and above (say) 12 entries. For instance, 12 entries, 3 high guns; 16 (or 17) entries, 4 high guns; 20 (or 22) entries, 5 high guns; 24 (or 27) entries, 6 high guns, and so on. It must be remembered that even with a highest possible mark there may be several winning scores below that mark.

We offer the above suggestions with a view to eliciting criticism on the same, and shall be glad to hear from all who are interested in the subject.

Dedham's Sportsmen's Club.

Boston, June 11.—Owing to the inclement weather there were but very few shooters at the Dedham Sportsmen's grounds, Dedham, Mass., Saturday. The badge match, 20 regular, Keystone system, was won by Mr. Parsons by a score of 18 out of 20. Events Nos. 8 and 9 will show the scores in this match. Mr. Cole was a close second with 17 birds to his credit. Clean scores were made by Mr. Moore and Mr. Parsons, each making 1; 890 birds were thrown during the afternoon, with scores as below. The total scores of the members were as follows:

	Shot at.	Broke.		Shot at.	Broke.
B Smith.....	188	98	Parsons.....	185	103
Moore.....	138	100	Cole.....	135	99
Gordon.....	100	87	Hollis.....	110	49
Brown.....	100	55			

ROBERT SMITH.

Binghamton Gun Club's Practice.

BINGHAMTON, N. Y., June 13.—The Binghamton Gun Club held a very interesting practice shoot at its grounds to-day. After a little preliminary practice the members shot a series of 10-bird sweeps. We had for a visitor Mr. Platt Adams, of New York city, who, as the score will show, was in good shooting trim. The weather conditions were unfavorable to good scores. Following are the scores:

Events:	1	2	3	4	5	6	7	8	9	10
Waldron.....	5	7	7
Adams.....	5	8	8	9	9	9	9	9	9	9

New York's State Shoot.

THE TOURNAMENT AT BUFFALO A THOROUGH SUCCESS.

The New York State shoot of 1896 must be reckoned as one of the most successful the Association has ever held. The attendance was excellent and the boys stayed to the finish. The weather on the first two days of the week (June 8-9) was decidedly against the tournament, but the preparations made by the Audubon Gun Club for the comfort of its guests and their protection from bad weather or a hot sun robbed those two gloomy days of more than half their terrors. The last four days of the tournament were favored by as lovely weather for trap-shooting as could be desired, and affairs on those days went proportionately pleasantly.

It is hard to see where the tournament officials of the Audubon Gun Club could have improved matters by additional forethought. This is high commendation probably, but the club had spared no expense in arranging and providing for every possible contingency. When the Association voted at the Saratoga convention last year to hold the State shoot of 1896 at Buffalo under the auspices of the Audubon Gun Club, the delegates of that club promised many things and talked volubly about what the club would do in '97. We heard those promises and that talk, and we now state positively that the Audubon Club made good every word spoken in its behalf at Saratoga's State shoot.

There was some preliminary practice work on Monday, June 8, but the week's work properly commenced when Mr. George Bleistein called to order.

THE CONVENTION OF 1896.

The annual convention was held on Monday night, June 8, in the Colonial parlors of the Genesee Hotel. Mr. George Bleistein president of the tournament officers, occupied the chair, Mr. John B. Sage acting as secretary and treasurer.

The attendance of delegates was very large, and the hotel parlors were taxed to the utmost limits. Among the clubs represented were: South Buffalo G. C.—L. C. Cranston, F. Anderson, Frank Long, Peter Sell.

Clyde G. C.—J. P. Howard, H. C. Watson, A. C. Burnett. Whitesboro G. C.—Robert Wilkeson, J. P. Schad, E. D. Wayman, C. L. Roberts, A. S. Hemler.

West Utica G. C.—Gustavas, J. P. Parker, W. Petre, F. Bard, P. Cursons.

West End G. C.—T. H. Green, A. J. McLure. Watertown G. C.—W. H. Tallett, O. M. Paddock, J. R. Powling, George D. Oliver.

Union G. C., of Western New York.—J. Olmstead, E. F. Hammond, Kelsey, E. W. Skey, Hy. Mydale.

Rome G. C.—S. H. Beach, A. C. McAdam, H. M. Poole, J. J. Armstrong, W. P. Rayland.

There was some discussion on the question of the handicap imposed upon certain experts by the Audubon Gun Club, but the action of that club met with very general approval among the delegates present.

AT AUBURN IN 1897.

The chief business of the convention was the election of officers and the choosing of the scene for the thirty-ninth annual convention and tournament. Both Rome and Auburn entered the field as candidates for the State shoot of 1897, and after a lively debate the roll was called. Auburn took the lead from the start, and it was soon apparent that that city would have an easy victory. This being the case, on motion of W. P. Rayland, of Rome, the choice of Auburn was made unanimous. Auburn promised to guarantee \$2,000 and throw targets at 2 cents each.

The following is a list of the officers for 1896-7: President, Charles G. Curtis; Vice-President, W. W. Dickinson; Secretary-Treasurer, Clarence E. Goodrich.

THE AUDUBON PARK GROUNDS.

The shoot was held at B. F. Smith's Audubon Park, 2865 Main street, about twenty-five minutes' ride by electric street cars from the center of the city. The location is very convenient and the trip an easy one.

Four sets of bluerock traps were used, Cruttenden & Card's kingbird target being thrown. This target is an excellent breaker and a good flyer; being slightly heavier than either the bluerock or empire, it can be thrown as far as either of those two targets with less tension on the mainspring of the traps. And the Audubon boys did throw them hard. On the first two days of the tournament (June 9-10) they were thrown as far and as fast as we have ever seen targets thrown. With a good wind blowing, added to fast targets, slow shots had no chance, while those who were accustomed to "pop ups" at home fell down by wholesale. No. 4 set of traps in particular was a very hard set to make a good score on, the flight of the targets at those traps on the first two days being variously estimated at from 75 to 90 yds. Personally we think 75 to 80 yds. was about the figure. This set was a brand new one that had just been received from Cleveland, and the springs were let down to the lowest notch, but still the targets flew as stated above. Had they been screwed up a few notches some of the targets would be going yet. Paul North, who arrived on the scene on Wednesday, reduced the speed somewhat, but still the shooting on that set was good and hard.

The traps were under the supervision of Jack Parker, who, together with the popular Crutty (W. H. Cruttenden), had control of the management of the shoot.

THE OFFICIALS.

The tournament officers were: President, George Bleistein; Vice-President, Chas. S. Burkhardt, president of the Audubon Gun Club; Secretary-Treasurer, George J. Schmidt, who occupies the same position in the Audubon Club.

In the cashier's office were: W. R. Hobart, of Newark, N. J., secretary of the New Jersey State Trap-Shooters' League; John B. Sage, secretary of the New York State Association since 1893; and George J. Schmidt, who is referred to above. A State shoot with a programme of confusion is bound to occur at the start. But once started everything here went as smoothly as possible, the tournament passing off easily and pleasantly during the last four days of the shoot. Considering the large number of entries and the double programme, the cashier's department did its work exceedingly well and promptly. The work entailed upon this department at such a shoot as this was must be personally experienced if a correct appreciation of the conditions is to be made and just criticism upon its work to be passed.

The referees were practical shooters who knew their business and who performed their duties well. Of course, a few mistakes were made; no one man can see everything, particularly when it comes to small chips that fall edgewise to the referee. Still the referees used good judgment, and the wisdom of having experienced men to fill these important positions was well exemplified at this shoot. The names of the referees were: No. 1 traps, B. Tolisma; No. 2, Fred. Emoud; No. 3, W. Meyers; No. 4, Al. Vagt.

The squad hustlers, each of whom walked many miles each day in the execution of his duties, were G. O. Miller, A. C. Suckol, Charles Doll and Al. Avery. The double programme—State and open events—made their work much harder than usual. Of course, also, there were many snooters who forgot their names and caused the expenditure of considerable unnecessary lung power.

To give a list of those who were present during the week would take up a column or more of our valuable space. Those interested in that particular must refer to the table of each day's scores, which will be found in their proper positions. A list of

THE TRADE REPRESENTATIVES

shows that manufacturers and dealers of sporting goods were well represented. Among those present under this head were: Dan Lefever and Col. A. G. Courtney, of the Lefever Arms Co.; Geo. Mosher, of the Syracuse Arms Co.; Harvey McMurchy and R. Hunter, of the Hunter

Arms (L. C. Smith gun) Co.; Sim Glover, shooting a Parker and using Schultze powder, and climbing to the top as usual; Jas. A. R. Elliott, of the Winchester Repeating Arms Co.; Alderman U. M. C. Thomas, of the U. M. C. Co., of Bridgeport, Conn.; A. P. Pope, pushing the interest of Schoverling, Daly & Gales, the U. S. agents for the Walsrode powder; M. Herrington, the New York representative of the Ladin & Rand W. A. powder; Noel E. Money, secretary of the American E. C. Powder Co.; W. L. Colville and J. S. Fanning, representing the Gold Dust powder; Carl von Lengerke, of Von Lengerke & Detmold, representing the interests of Schultze powder and exhibiting a beautiful lot of Francotte guns; etc., etc.

THE HANDICAP ON EXPERTS.

As announced in the programme, experts were forced to shoot into first or second money or get nothing. This rule had the effect of drawing some additional entries, and also of keeping some of the boys shooting during the whole of the tournament. That it was a hard game for the experts is shown by the scores of the second day, when McMurchy broke 92 per cent, and never got a place all day, although he broke 47 out of 50 in the E. C. cup contest which A. M. Schermerhorn won with 49 out of 50, the 48 hole always being occupied. The handicap was not strictly adhered to all through the tournament, the tournament committee deciding to take the penalty off certain shooters. McMurchy, Elliott, E. D. Fulford and Sim Glover, however, bore the yoke through the entire shoot. It did not bother Glover much, as he shot a wonderful gait the whole of the tournament and finally landed a big winner when it was all over. He fully earned all he made, his great scores being the result of some magnificent shooting on hard-thrown targets.

THE STATE EVENTS.

The programme for each of the first three days contained two State events at 25 targets each. State event No. 4 was shot on the afternoon of the second day and was a merchandise event. The entry list in this event was very large and it took all Thursday morning to decide the ties for the merchandise prizes, there being eight classes of prize winners. The Audubon Club also announced 9 prizes for averages in these 6 events. Below is a list of the winners, with their averages, each man having shot at 150 targets:

	Shot at.	Av.		Shot at.	Av.
1. Glover.....	142	94.6	6. { Edwards.....	129	86
2. McMurchy.....	137	91.3	7. { R. Hunter.....	129	86
3. Livingston.....	126	90.6	8. { Gates.....	128	85.3
4. Whitney.....	133	88.6	9. { C. Lane.....	127	85.3
5. { Tuttle.....	130	86.6	8. { J. W. Fulford.....	127	84.6
Hammond.....	130	85.6	9. { Norris.....	125	83.3
			Schorty.....	125	83.3

Below is a table showing the scores made by each shooter in the above-mentioned 6 State events, and also giving each man's percentage of breaks:

Events:	1	2	3	4	5	6

Flick.....	148	87	Mayhew.....	151	88.8
E O Meyer.....	143	84.1	Richmond.....	140	82.3

The main event in the open-to-all programme was No. 5, the Buffalo Times event, 50 targets, unknown angles, \$3 entrance, \$125 added to the purse by the Times, eight moneys. At one time it looked as if Glover with 48 and Whitney and McMurchy with 47 each would be easily in first and second place. T. C. Graham, however, with his Winchester and W-A powder, jumped in and broke 49, carrying off first money all alone. The scores in this event will be found in the table of scores under the head of No. 5.

The State events were three in number. The first was at 25 targets, unknown angles, \$3 entrance, \$75 added by the Courier Company, that company also adding \$25 to the purse in the team shoot that takes place on the fourth day. No. 2 was a similar event with \$75 added. The third event, State event No. 7, was the contest for the Lefever Arms Company's diamond medal. The conditions of the shoot are 20 singles, known traps and angles, and 5 pairs. In this contest Sim Glover added to his laurels by running 19 out of 20 in the singles and then breaking his 5 pairs without an error. A special feature of the shooting at doubles was the speed of the targets, the No. 4 set of traps being requisitioned for this part of the contest. Harry Whitney was second with 28, E. D. Fulford and E. D. Kelsey being third with 27. The entrance to this event was \$3; the medal, won last year by Dan Lefever, and 25 per cent. of the purse going to the winner; the balance was divided into five moneys. Below are the scores of this event in detail:

Those who shot in only one event were:
No. 1: A. Barker 12, Doan 15, Brown 17.
No. 3: Corning 10.
No. 4: Killick 13, R. H. 5, Sole 8.
No. 5: Moodie 34, Courtney 43, G. O. Miller 30, E. W. Smith 42, McArthur 34, Borst 37, Paddock 38, R. P. Wilson 29, P. G. Meyer 29.
No. 6: Daw 12, Hawkins 8, Inderbitzen 4, Snyder 7, Truesdale 13, Krotz 16, Burgundy 10.
No. 7: Fries 16.

FOURTH DAY, JUNE 12.
Less wind, a good light and targets thrown a little easier than during the first three days of the tournament, made the scores on this, the last target day of the shoot, run slightly higher as a general rule. Glover and Whitney tied for first honors with a percentage of 92.3, Lane being second with 90.6, and Flick third with just 90 per cent. The attendance was wonderfully good, 27 shooters taking part in all the open events, while the Audubon Club event, No. 5 in the open list, had 78 entries at \$5 each. Below is a table of the averages made by the 27 shooters who shot through the programme of open events that called for a total of 170 targets:

	Broke.	Av.		Broke.	Av.
S Glover.....	157	92.3	L H Schortemeier.....	145	85.2
H Whitney.....	157	92.3	L V Beyer.....	143	84.1
C Lane.....	154	90.6	T C Graham.....	143	84.1
Flick.....	153	90	C Wagner.....	143	84.1
J A R Elliott.....	152	89.4	C W Hobbie.....	142	83.5
E C Meyers.....	152	89.4	J S Fanning.....	141	82.9
H M Levenson.....	151	88.8	C A Tuttle.....	138	81.1
F S Edwards.....	150	88.2	A P Pope.....	137	80.5
N Appar.....	149	87.6	N E Money.....	136	80
H McMurchy.....	148	87	J Hallowell.....	134	78.8
A Forrester.....	147	86.4	M Mayhew.....	133	78.2
F D Kelsey.....	147	86.4	J G Lindsay.....	131	77
S Glover.....	145	85.2	M Herrington.....	129	75.8
McVey.....	145	85.2			

With the close of to-day's programme of open events came the figuring up of the general averages of the four days. The 28 events on the programme, 7 for each day, made a total of 680 targets shot at. Out of all the shooters that took part in the New York State shoot of 1896 only 14 shot through the above list of events. Their names, the positions they occupied at the finish, the total number of targets broken by each out of the 680 shot at, and the amount of average money won by each follow:

1. Glover.....619.....\$30 8. Flick.....562.....\$10
2. Whitney.....616.....\$30 9. Fanning.....560.....\$5
3. McMurchy.....613.....\$25 10. Kelsey.....560.....\$5
4. Lane.....596.....\$20 11. Meyer.....557.....\$5
5. Levenson.....588.....\$15 11. Byer.....555.....\$5
6. McVey.....570.....\$10 12. T C Graham.....542.....\$5
7. Wagner.....567.....\$10 13. J G Henry.....518.....\$5
McMurchy's comparatively poor score is directly attributable to the breakdown of his gun, which compelled him to shoot nearly all day with a strange weapon.

STATUTE EVENTS.
There were only two events on the programme from which residents of other States were barred. The first was a \$1 miss-and-out. This

was shot off at the No. 1 set of traps, and resulted in Schortemeier winning first place and the privilege of a free passage to Mackinac and return on one of the magnificent steamers owned and run by the Northern Steamship Co.—the North West or the North Land. There were several other merchandise prizes that fell to the lot of the other shooters in this event. The scores were:

Miss-and-out, entrance \$1, merchandise prizes, 40 entries: Shorty 26, E. Fulford 25, J. Fulford 21, Hobbie 19, A. E. Story 16, Glover 16, Hammond 15, E. Meyer 14, Bennett 13, Whitney 13, Lane 12, H. Lowden 11, Gates 10, Hanks 8, Mayhew 8, Wagner 7, Norris 6, B. Wheeler 6, Frank 6, Howard 6, Benedict 6, Kelsey 5, E. C. B. 4, Lowden 4, Tuttle 4, M. E. Barker 4, Paddock 3, Tallett 3, Edwards 3, Ward 3, Norton 3, Livingston 3, Wride 3, Corning 2, Forrester 2, C. S. B. 2, Lefevre 2, A. M. S. 2, Baker 0, Byer 0.

The other State event was the 4-men team race, 25 targets per man, known angles, entrance \$12 per man. First prize, \$100 Parker gun to order winner, donated by Parker Bros.

ROCHESTER'S GREAT SCORE.
This contest was looked upon as quite an open affair and likely to be productive of a good and exciting contest. As a matter of fact, the scores ruled very high, but Rochester's total led the others by the comfortable margin of 5 breaks, the team representing the Rochester Rod and Gun Club piling up the big score of 98 out of 100, three out of the four men making straight scores. The squad in which this team shot was made up as follows: E. D. Fulford and J. W. Fulford, members of the Oneida County Sportsmen's Club, and the four men on the Rochester team. As will be seen by reference to the scores given below, this squad ran up the big total of 145 out of 150 shot at. It is true the targets were not thrown very far or fast to-day on this set of traps (No. 1), but still the totals are excellent under any conditions. Scores.

The Oneida County Sportsmen's Club and the Audubon Club shot off the tie for second place at 5 targets per man. The result was as follows the Utica team taking second place:		
O. C. Sportsmen's Club: J. Fulford 5, Gates 5, E. D. Fulford 4, Mayhew 4-18.		
Audubon Club: Kirkover 5, Forrester 4, Hanks 4, Norris 4-17.		

The accommodations of the region are very thoroughly covered, and we can form a very fair idea of each locality from the accompanying photographs. Six maps show routes to various stations, and in-

Forest and Stream Water Colors

We have prepared as premiums a series of four artistic and beautiful reproductions of original water colors, painted expressly for the FOREST AND STREAM. The subjects are outdoor scenes:

Jacksnipe Coming In. "He's Got Them" (Quail Shooting). Vigilant and Valkyrie. Bass Fishing at Block Island.

The plates are for frames 14 x 19 in. They are done in twelve colors, and are rich in effect. They are furnished to old or new subscribers on the following terms:

Forest and Stream one year and the set of four pictures, \$5.
Forest and Stream 6 months and any two of the pictures, \$3.
Price of the pictures alone, \$1.50 each; \$5 for the set.

Remit by express money order or postal money order. Make orders payable to

SNAP SHOTS.

Count Henry de Puyjalon, whose sketch, "My Pastor," in our issue of May 23 attracted much attention, to-day contributes another story of life in the far north, and others are in hand for early publication. These word pictures of man and other animals in Labrador are doubly interesting as revealing to us that there is poetry and sentiment even in the homely lives of the dwellers in that bleak land of desolation, if only one possesses the insight to perceive it and the skill to tell it. Count de Puyjalon's is an interesting personality. Of a family belonging to the old French noblesse, he was born in France, entered the army, and was at one time honorary aid-de-camp to the King of Denmark. In his youth he traveled a great deal, going as far north as Siberia, and had by a series of misfortunes lost his private fortune when the Franco-Prussian war broke out. He was severely wounded while serving in the army of the Loire. When the war was over he crossed the seas to Canada, and as he was fond of solitude and anxious to prosecute his study of natural history and geology, he took to the woods and gradually drifted to Labrador, where he has resided almost continually ever since, exploring the country, studying its geology and natural features, hunting, trapping and fishing. Although a thorough man of the world, of very polished manners and very well educated, he is never happy except when in his beloved Labrador, and especially when camped out in the woods, either in summer or winter. His wife has not hesitated to follow him to the bleak coast of Labrador and to stay in a lonely lighthouse, of which he was a keeper for a while, in the Mingan archipelago, a position to which he got himself appointed better to study the habits of the sea-birds and seals. The original manuscripts of Count de Puyjalon's contributions to the FOREST AND STREAM are written in French, being translated for us by Mr. Crawford Lindsay, of Ontario.

Every season is the sportsman's own, and June itself is one of his months. For the simple pursuit of game is by no means all there is in the world as seen through the sportsman's eyes. If that were indeed the whole of field sports we should have little to record of it in print, and few of us would care to read what might be written. He has not crossed the threshold of sport who has not felt the fascination of the sights and sounds of nature, nor can one who has eye and ear for the manifold charms of the outdoor world go afield in January or in June without finding abundant entertainment and reward. For the sportsman June holds out manifold attractions. The quail's whistle is heard from the fields of the farm, and if one knows the familiar haunt he may come almost to familiar terms with Bob White as he perches daintily

on the old wall where the pink of the wild roses gives color to the gray stones. In the mountain woods road, now almost reclaimed by the genii of the place, one comes upon the dusting beds of the partridge, and perchance is greeted by the heavy wing beat of the bird itself and catches a glimpse of its receding form. These are but homely incidents of a day in the country, and yet in them is found a satisfaction many a graybeard would go far to make his own.

GEN. BRISTOW.

GEN. BENJAMIN HELM BRISTOW, soldier, statesman and jurist, died on Monday morning at his residence in this city.

He was born in Elkton, Ky., sixty-four years ago, and was educated at Jefferson College, Pennsylvania. After reaching manhood he practiced law in Kentucky until the breaking out of the war, when he entered the Union Army as lieutenant-colonel. He took part in the capture of Fort Donelson and was wounded at Shiloh. Later he became colonel of the 8th Kentucky Cavalry. While still in the army he was elected to the State Senate of Kentucky. He was afterward United States District Attorney for the district of Louisville, and in 1870 was appointed Solicitor General of the United States. In 1873 he was nominated Attorney-General of the United States, but was not confirmed. In 1874 he was appointed Secretary of the Treasury, and his administration of that Department is remembered for his warfare on the whisky ring. In 1878 he came to New York and, as the head of the firm of Bristow, Peet & Opdyke, practiced his profession here. He was for a term president of the Bar Association. He was a member of many clubs, and at the time of his death was President of the Boone and Crockett Club.

Gen. Bristow was a keen sportsman, and had spent much time in the West hunting big game. He was deeply interested in the preservation of the Yellowstone National Park, and on many occasions used his influence to bring about legislation looking to this end.

Gen. Bristow's eminence in whatever he undertook is sufficiently well known. What may not be so generally known is the strong personal charm which he possessed. To the physique of a giant and the courtly manners of a gentleman of the old school were united the gentleness and tenderness of a woman. Few men have about them so much that is lovable, and the grief felt at his loss by his close associates will be understood by all who have ever been brought in contact with him.

THE RANGE IN WINTER.

THERE comes a time on the range when the sun is as bright as in midsummer, but has no power to temper the bitter cold. The gray soil, which in July seems to suck in the heated rays and to give them out again, making the dry air dance and quiver, is now hard frozen, and in the ravines lie banks of snow swept from the prairie and piled up here in masses hardened by wind and frost, over which the horses pass, barely marking them with their hoof prints. In the arch above, blue as a summer sky, two mock suns keep company with the real one, but they give light alone, not warmth. A bitter wind sweeps over the plain.

Horses and cattle which six months ago were short-haired and smooth now wear long shaggy coats that are ruffled or flattened by every breeze, and their brands are hidden under the heavy covering. The antelope which in summer are scattered out in little groups—two or three old does and their kids, and little clusters of bucks and yearlings—are now associated in herds, hundreds together. Prairie dogs, wild ducks, curlews and plover have long since disappeared. The hares that were gray are white now. Great brown war eagles and fierce hawks perch on the points of the bluffs and watch for their prey. The raven croaks discontentedly as he flies across the plain. Down in the stream bed near the aspens the willow grouse feed in packs of hundreds, and amid the sage brush are hundreds of their greater cousins, the sage grouse. Flocks of snow birds and gray-crowned finches sometimes whirl over the plain, like wreaths borne by the wind from distant snow banks.

Even at this bitter season the lonely figure of the range rider is seen, but now more infrequently than at the time of the round-ups. Not willingly does the most callous ranch boss now send out one of his boys to face the dangers that the fierce breath of winter brings over the sum-

mit of the Continental Divide. Yet some riding has to be done and some lives must be sacrificed. It is no light matter though that takes the rider abroad at this season. He will not go in for the mail nor go visiting, nor will he go hunting, except when the promise of good weather seems very certain. And when he sets out for a ride, he does not slight his preparations, as often he may in summer. He knows well the perils of a winter ride—what it may mean to be lost in a winter snowstorm, when in an instant all landmarks are swept from view; when at once all sense of direction is lost; when the wind, whirling and eddying about every knoll and through every ravine, seems to come successively from every point of the compass and cannot be depended on for a guide; when one's horse cannot be relied on to keep the direction, and continually tries to turn tail to the blast. So the rider prepares himself. He puts on a cap with ear flaps, or ties down the brim of his broad hat over his ears; he dons extra trousers and shirts until, instead of being a slender man, he seems stoutly built, and waddles as he walks. His feet are covered with arctics or with German socks. The saddling of his horse is a slow process now, since to do it he must remove the huge mittens he has assumed, and many times during the task he is obliged to stop to warm his stiffened fingers. Perhaps when the horse is saddled the rider goes into the house for a final warming up and a pipe, and then at last comes out again, mounts and rides away.

Whether his ride be long or short, it is fast, except when from time to time he dismounts and, after pulling the ice from muzzle and bit, leads his horse as he runs along to start his blood to circulating once more. If the weather continues fair he will reach his destination with only a little suffering to mark the ride in memory, but it may not continue fair. Perhaps as he swings along at a short easy gallop he sees hanging over a distant prairie swell a little cloud of mist, which disappears as he passes down into the hollow, and when he reaches the next hill is seen again and nearer. Well for the rider then if some ranch is near, or if he is in a country that he knows so well that he can travel it with shut eyes, so that he may find some shelter before the storm is upon him.

Little by little the more distant landscape is blotted out and the cloud rolls nearer and nearer until it is close to him, and at last on a sudden it seizes him with stinging grasp, and the day has changed from brilliant sunlight to gray twilight. The blast blows fiercely, bearing on its wings a million icy particles which cut the skin like tiny scourges, and which the horse will not long face. Nothing can be seen save the ground at the horse's feet, for the flying *poudre* is impenetrable by the sight. Unless he can find a shelter or a lee the rider must turn and travel with the wind. The roar and whistle of the storm, the whirling clouds of flying snow and the intense cold tend to confuse and stupefy both man and horse, and yet as they stumble on over the prairie both need their wits now as perhaps never before.

Perhaps as they are so groping their way along, stung by the flying ice flakes, pushed about and beaten by the power of the gale and stiffened by the cold, they may hear strange moans and cries in the air about them. Drifting along before the storm with heads held low comes a bunch of cattle, seeking some shelter from the bone-piercing wind. Strung out one after another—perhaps ten, perhaps one hundred—they move steadily if slowly along. Low moans come from them which may be cries of pain or perhaps calls to one another of encouragement or companionship. Long jets of white steam shoot out from their ice-laden muzzles toward the ground. Particles of ice and snow cling to their long, shaggy hair. The tired, half-frozen calves bawl in shrill remonstrance and bunt their mothers to induce them to stop, but only when her calf falls and cannot rise again does a cow pause and stop behind to die with her little one. Out of the gray storm they have come; into its whirling mists they disappear, and their muttering voices sound fainter and more faint and at last are drowned in the rush and tumult of the gale.

If the rider knows his country he will in his drifting bring up somewhere at house or behind some shelter where he may wait until the storm shall have ceased, and then resume his way, perhaps unharmed or perhaps losing hands or feet from his exposure; or, if hopelessly confused and lost, he may ride on and on until at length overcome by fatigue and stupefied by the cold, he yields to the desire for rest and falls asleep for the last time. So many have slept.

The Sportsman Tourist.

LABRADOR SKETCHES.

II.—My Dog.

HIS name was Bear (*Ours*). He was about three years old when I first saw him at Cawis Point, where I was compelled to land to avoid being caught by the ice floes driven toward the shore by the gale outside. There was a heavy sea and the rampart of ice piled up on the beach made landing very difficult.

Being fully occupied in seeing to my safety and that of my hired man, I paid little heed to the articles lying in the boat, and when we touched the shore my woolen jumper, which I had taken off to leave my arms free, was washed away and I thought it lost forever.

When we had hauled the boat up and placed our effects in safety we were about to start for a fisherman's house, when my man, Thomas, called my attention to one of the great waves about to break on the ice-bound shore. The head of a dog, holding my jumper in its teeth, appeared above the water. The shock of the breaking surf would be terrible, and what was to become of that imprudent and plucky animal? The wave rose higher and higher, was already curling into foam and in a few seconds would break on the strand. When the dog saw the crest rising, he turned right about with his head out to sea, so that when the wave broke he was still a few feet from the water-line and landed without a shock. In a twinkling he jumped over the rampart and gave himself a vigorous shake on dry land. I called him and he laid my frozen garment at my feet. I patted him on the head, praised him for his skill, and the wagging of his tail showed that he appreciated my remarks.

Having thus expressed my gratitude, we went to the fisherman's house, where we dried our clothes, warmed our benumbed limbs and enjoyed a well-earned smoke.

After a while our host, who was very proud of his winter's trapping, offered to show me his furs in his storehouse. As we went out he saw our four-footed hero and, without saying a word, he took up a stick and began beating the poor animal most unmercifully. I could not stand this, so I stopped him and asked what the dog had done. "He has been away for three days," was the answer. "Perhaps he is in love," I suggested. "In love! Not he! He is much more inclined to hate than love. He spends all his time in the woods killing porcupines, which he does not eat, and he gets his mouth stuck full of quills. Some of these days they will be the death of him. He is a good dog and a good hauler; he swims like a fish, but he is no use to me."

The upshot was that I bought this paragon of dogs for \$3. His forefathers lived on the French shore of Newfoundland, where the memory of their virtues and great deeds still lives. I am not quite sure whether he had a clear idea of the duties which the traditions of his ancestors imposed upon him, but I think so, judging from the dignity of his demeanor and the expression of his eye. I cannot say that he was a beauty. He was black, but of a dull color; his feet were rather heavy and half webbed; his ears were short and his tail had lost most of the long hairs which formerly adorned it. His eye was remarkable, small but bright, with an eloquent and varied expression. For me and mine it expressed unbounded affection; for his enemies, the seals and porcupines, it became quite fierce; he could hate as well as he could love.

Whence came this hatred, almost bordering on ferocity? What had these animals, usually so gentle and timid, done to him in the course of his short life? I never could find out, although I asked him. I often spoke to him and he answered me, for you know he is but a poor hunter who cannot understand his dog and make his dog understand him.

I had the most complete control over his passions. I have seen him resist the most attractive temptations at my slightest call. I was his only love; he loved those whom I loved and disliked those whom I disliked, and was strictly polite with those to whom I was indifferent. When I first brought my wife to my camp he showed her the most sympathetic affection, and when God gave us two little ones he was a second father to them. Harnessed to a small sled, he would drive them about on the beach, and nothing could exceed his careful and prudent behaviour. One day, however, hatred nearly overcame his sense of duty, and I had to undergo one of the greatest anxieties I had ever felt.

While Bear was hauling my eldest child, then two years old, on the beach, I climbed up on a rock to observe some seals which had landed and to endeavor to attract others which I saw swimming close by. One of them, attracted by my lures, came within range and I shot him. At the sound of the detonation the dog lifted his head and perceived my victim struggling on the surface of the water. Carried away by his hatred and forgetful of his precious charge, he set off at a gallop for the sea, which was about to swallow up sled and child, when I uttered a loud cry and jumped up on the rock on which I lay. He stopped at once, looked at the child, who had begun to cry at his unexpected bath, and quietly trotted off to the house, meeting my wife, who had witnessed the scene from afar and had rushed down for the baby.

I gave up my hunting and came ashore to join them. The dog looked as if he expected a severe punishment, but I had not the heart to give it to him. I merely took him by the ear and gave him a scolding, which he well understood. With the exception of this incident, which was really attributable to my own imprudence, I never had to find fault with him.

He had every quality which a dog should have, and he lost his life while helping me to keep my family from perishing of cold. It was in 1889. I was in temporary charge of the lighthouse on Puffin Island, a rocky islet three miles from shore, in the midst of the most dangerous eddies and currents, whose only denizens previous to my arrival were gannets and the sea parrots or puffins from which it takes its name. In winter all communication is cut off owing to the ice being constantly in motion. As I reached there late in the fall, I was unable to procure a sufficient supply of wood for the winter. This was a very serious matter in such a situation and in such a climate. I set to work at once to collect all the driftwood I could find on my island and the smaller ones near it. I got together several piles of this wood, which is carried down by the spring freshets, and we went for it as it was required,

About the middle of March all the wood on the lighthouse island was exhausted and I had to supply myself from the other islands, which were connected with mine by an apparently solid ice bridge, consisting of ice floes packed together, and which stretched away out to sea as far as the eye could reach from the light tower.

After sounding the ice I set out with my man and Bear, who was quite delighted to be harnessed to a sled. For three days we hauled wood to the house, and at the end of the third, while we were taking our last load, pulling with the dog as hard as we could, and had almost reached the rampart on the shore, the ice, weakened underneath by the action of the current, suddenly gave way behind us and the unfortunate dog, caught between the shafts of the loaded sleigh, was carried under the ice by the water rushing past like a torrent. For some moments we held on to the line and pulled with might and main, hoping to save the poor animal, when the line broke and he disappeared under the floe. I was about to jump in with the insane idea of helping him out, but my man, who saw the danger, caught me by the arm and held me. I sat down on the ice and am not ashamed to say that I cried bitterly.

Such was the end of poor Bear.

H. DE PUYJALONS.

FISHING AND WILD FLOWERS.

IT is raining. I believe it was raining when I last wrote. But it hasn't rained continually since, as some carping people might be disposed to assume because this is in Washington. Oh, no. There have been days, as many as several, when the sun rose in an unclouded sky, ran his daily race undimmed and hadn't a single cloud coverlet to pull over him as he bade us good night. Those were glorious days. Just the sort in which to go a-fishing, and being so, if a person didn't utilize them properly precious time was wasted and he had repinings. (Excuse me a moment, please, I see a bluejay on the fence. Bluejays are thieves, robbers and vandals. They come early in the morning before we are up and pull up corn and peas and other garden sass, and the garden is small and we can't afford it. They do us harm and not good. They are to us evil and evil only. What they might be to people back East who nurse bluejays I do not know, and care not. Here we have bluejays to burn—powder on. It is a case of survival of the fittest, and we are that same. Bluejays here are different from the Eastern bird—they are solid indigo blue all over; and again they are the same—they scream and scold. This one will scream no more; he is gathered. Let us resume.) In order to avoid bitter regrets I went fishing one of those days.

I got up middling early for me and got away at about 6:30. Did it all without the blood-curdling rattle of the deadly alarm clock too. Positive fact, I merely note it as showing that a man can rise and go fishing (and probably hunting) without the time-worn experience of the alarm clock.

I had no beast to ride, and there was not a wagon on the place. There are no wagon roads and the hills are so steep that I couldn't have used a wagon if I'd had one, so I went afoot. I'd rather go afoot anyway—under the circumstances—one has time to see things. The stream I sought was over the hills and miles away, and there was naught but a trail to follow, very dim in places, and in addition part of the way was by a trail unused for years, never followed by me, overgrown with sal-lal brush and dim enough here and there to awaken a delightful uncertainty as to there having been any trail in that section. But that made it all the more interesting. True, if I lost it entirely I might wander around all day in that dense, gloomy fir forest, and the fishing would have to be put off until another day, but it was exploration just as much as though it were along the Congo, and as I couldn't go there this would have to answer, I might have gone around further by a plainer trail, but I wanted to indulge my curiosity a little and test my ability to pick up something faint. Then there was the delight of seeing strange country and the possibility of running across a pterodactyl or a dodo or something to tell about. I'm very glad I didn't, however, for I took no gun, concluding before starting that 9lbs. of Marlin and a few pounds of trout would be too much for comfort.

Part of my way the first hour—after I had left the valley and climbed a heart-breaking hill of several hundred nearly perpendicular feet—lay through a tract that had long since been burned over, where trees were sparse, and where rhododendron and huckleberry were in full sway, and here I feasted my eyes on one of the most beautiful sights I have ever witnessed. It was the season of full bloom of the rhododendron, and there were acres and acres of the loveliest pink-bedecked bushes that were ever arrayed for the delectation of man. Here and there where the bushes stood thickly were masses of the softest, most delicate beautiful pink ever painted by the great Artist, and scattered all over that large area, never far apart, were innumerable clusters of dainty blossoms, a panorama of exquisite beauty, matchless, indescribable. Verily, there is something in Washington besides rain. I'm glad I went fishing. A person is most always glad when he does right.

The rhododendron is in full flower now all over the State, and on the hills one is rarely out of sight of the beautiful bloom, but it is only now and then that one is granted such a view as I have hinted at. Sometimes, as on this day, even in the deepest recesses of the forest, one may see a spot of pink, a lovely bush among the gloomy shadows glowing from between the thickly towering tree trunks, a brave bright smile in spite of somber shades that is most charming.

This is a favored country for flowers. The wild rose bushes are sheets of fragrant flame; all the berries, and their name is legion, are in bloom almost everywhere. In the damp bottoms along the creeks, along the hillsides in the thick woods, in the clearings, through the burned tracts on the hills, where there is seemingly naught but garvel and rock; every place has its favorite flower, modest or gay and flaunting. I am sorry I cannot give the botanical names of all these plants; it would be such a comfort. But I don't carry a botany with me, and the one I studied in my youth did not say anything about Washington varieties. However, I know a flower when I see it, and can admire its beauty and sniff its fragrance just the same. There is a bush which grows on the upper levels here that exudes lightly, from its leaves, a moisture slightly viscous and of balsamic, aromatic odor that is very pleasant, and I never miss an opportunity when

near it of passing my hands over the leaves, and so taking an impalpable bouquet along with me for a season. It is in bloom now and the white blossoms have a faint, dainty odor that is very pleasant. The dogwood is in bloom now also, holding out handsome flowers like saucers without the cups, and flecking with white the greenery that crowds it closely in the thickets; while the ferns, Washington's representative plants, of all sorts and sizes, are everywhere, mounting into the air and still growing as though they would never stop. Over 8ft. high is the common variety now of this season's growth in good soil, and shows no sign of calling a halt. Of course good soil is not omnipresent, and you don't find such growth broadcast, but it is nothing unusual in the valleys. But the maidenheads! You should see the masses of delicate, graceful fronds hanging over some bank in the cool shade, where the water trickles musically down, and the passing breeze dallies with their graceful tresses. It is a sight for weary eyes that find one poor puny fern in twenty-five square miles in the effete East. And the sword-ferns too, with their broad, gracefully formed, sharp blades, unsheathed, standing straight in clusters, full of strength, as though anxious to be given an opportunity to show their prowess in some gay tournament where knights of fair Flora should contend for the wreath of victory at the hands of their beautiful queen. They are also finely in evidence, and there are many other lovely things to be had for the search, between showers, if one is in the humor.

The mosses too, to be found everywhere in many varieties in the damp, cool spots, are as lovely creations as can well be imagined, and a book of them pressed makes a beautiful souvenir that any one might be proud to possess. But the seaweeds and mosses! Who can fittingly describe those inexpressibly dainty, graceful, waving, floating, almost ethereal creations, nurtured by the salt waves and tinted in such colors as defy the art of man, and cause exclamations of wonder and delight by all who behold them. Tastefully mounted on cardboard, they are a source of never-ending admiration. I have seen collections from Eastern shores, but I do not remember to have seen any that approach these in point of color or variety. Verily, I remark once more, there is something else besides rain in Washington. There is, there is.

You remember that in one of my recent letters I mentioned finding a water ousel's nest on one of my fishing trips and bringing it home with me. Well, I visited the same spot on this last trip, of which I said something in the beginning of this letter, and found that the despoiled beauties had forthwith gone to work and built another nest in the same place, on a little sloping shelf on almost a perpendicular rock wall close by the spray of the fall; but this last nest is double, one nest just above the other, connected, the entrances about 6in. apart, but interiors not connected. Two separate nests in the same bunch of moss. The upper was empty, but the lower contained four eggs and a just hatched wee little ouselette, but what surprised me as much as anything was the size of the eggs. They were immense for the size of the bird, almost as large, it seemed to me, as those of the robin. They were slightly larger at one end than the other and in color pure white. It seemed to me a big disproportion between the size of bird and egg and a pretty big tax on the hen, but she seems to stand it all right. Now what do you suppose that upper nest was for? I couldn't see that it was one whit inferior to the lower. It was just as well built, finished and protected as the other, to my unprofessional eye, but probably there were faults or deficiencies in it which couldn't be accepted or overlooked by the architects, and so they built another. But I think they built the upper nest last, from the aspect of things. Then what? Why, they either intended the spare nest for the next robber or their ambition to raise a family was greater than their capacity, or they intended the upper nest for a nursery. I couldn't find out which, for there was no one at home when I called, and I left the nest as it was, hoping that no one would spy it out and so interfere with domestic bliss in the ousel family. The double nest was not as large as the first single one. I could not see into it, of course, for the entrance was upward and then inward, overhung by a mossy hood, preventing my inlook, even had I been on a level with it, which I was not by a foot or two, having to reach up and explore the interior with my fingers.

Coming home after a day of unalloyed delight, I surprised a mother grouse (ruffed) with her brood in a bend of the trail, and the usual grouse ground and lofty tumbling immediately ensued, preceded by a performance. I do not remember to have seen before. This was the raising and spreading her tail exactly like that of a turkey cock when he is strutting, and waltzing around with her tail in the air with an air of defiance that was funny enough. Then suddenly all her legs and wings were broken, and she flapped and fluttered, edging gradually away, clucking and warning, circling around and coming toward me again, finally stopping, and opening her bill widely uttered a cry or squawk very like a domestic hen when seized, but of course not so loud. She repeated this a good many times, finally flying to a lower limb of a tree near by, where I left her to reassemble her brood, that had suddenly become invisible to my careful search, as only young grouse or quail can.

Oh! About the fish? Well, I brought home thirty-two trout, lovely black-spotted mountain trout, the longest 11½in. and the shortest just short of 10in., having thrown back but five that were only a little smaller, and when the catch was laid out on a bench at the home coming, with their heads on a line, I thought that, considering the number, the number thrown back and the average size, it was a pretty sight and well worth the ten-mile tramp it took to get them, and also a sore heel and a lame knee or two. The coachman did the business. O. O. S.

WASHINGTON, June 1.

Where Would I Hold?

MR. WILMOT TOWNSEND, of Bay Ridge, N. Y., has supplemented his well-known and ingenious drawing, "Where would You Hold?" with another, entitled "Where would I Hold? There with my First." The first picture shows a group of broadbills which have just come within range, and are so grouped as to give a chance for two birds at one shot, if only one knew just where to hold. The second and companion picture shows the effect of holding on the spot chosen by the artist. Mr. Townsend tells us that the edition of his picture, "Outside the Danger Line," has been sold out.

Natural History.

EREBUS AND THE HUMMINGBIRD.

MRS. ANNIE A. PRESTON.

WILLINGTON, Conn.—As I went out upon the front piazza early one August morning to note the sunrise splendors that were crowning the mountain tops, I noticed Erebus, the big, sleek, black cat, stretched out under the clustering, many-hued morning glory bells. He was sleeping with one eye, while with the other he was casting longing glances up at the beautiful, poising, circling hummingbirds that were diving in and out among the luxuriant vine leaves and thrusting their needle-like bills down the slender throats of the brilliant though transient blossoms.

Two or three minutes later he came bounding through the hall into the sitting-room, and Emma shouted:

"Oh, dear, dear! that cruel Erebus has caught a hummingbird!"

"Impossible," cried mother, running from the pantry. "I never knew a cat to catch a hummingbird; 'Rebus might as well attempt to catch a shadow or a sunbeam."

"Nevertheless this cat has a hummingbird in his mouth now. I can just see its poor, pretty feathers, and this dreadful cat is going to swallow it whole. Oh, dear! what can be done?" And the young girl seized the cat more roughly than he was ever touched before, whereupon he growled resentfully, arched his back, whipped his long, fluffy tail to and fro, extended his white, sharp claws and made another great effort to swallow his tiny prey. But the young mistress held him so closely by the throat that he did not succeed in so disposing of his delicate morsel.

As we all gathered about 'Rebus, we could see the silvery dots on the tips of the long, gossamer tail-feathers of the wee bird just protruding between the sharp, cruel teeth, and "peep, peep," came faintly from the cat's closed mouth.

"The poor little thing is still alive! Erebus, you great cruel cat, you shall give it up," and Emma clasped her slender hands so closely about his throat that his shining yellow eyes protruded, his strong jaws relaxed and a very wet, tiny hummingbird was extracted from its place of peril.

"Oh, dear, it is dead!" sighed Emma, holding up the limp little morsel of a bird. "Take it away; I can't bear to look at it! I can never pat 'Rebus again, naughty old black!" and 'Rebus shook himself assertively, fell to licking his paws a moment, then casting a reproachful glance around at the assembled family he gave an expostulating mew, and walking deliberately out of the room stretched himself upon the sunny piazza again.

Mother took the dainty little bird and held it safely in her warm hand, and we all congratulated ourselves upon having an opportunity to examine the wonderful little tidbit.

How perfectly beautiful it was, from its long slender bill, the pert little scarlet tuft on the crown of his cunning head, the brilliant, ever-changing plumage of its plump breast, fairly-like wings and narrow tapering back to its mites of delicate legs and feet.

All at once, while we stood exclaiming over the pretty creature it gave a gasp, then another, then another a little deeper and stronger. Mother now carried it along to the front of the porch and held it in the sun.

Presently it opened its specks of black eyes, looked around at us in a bewildered sort of way and stretched out its green and gold neck, straightened first one leg and then the other, as if trying their strength. Then ruffling up his feathers as much as to say, "Now I'm all right," he hopped upon one of the fingers of the friendly hand which had so tenderly held him and began to plume his elegant plumage, drawing each tail and wing feather through his long slender bill.

Emma wiped her eyes now and came running out to look at the little wonder. "Your mouth is too large for a hummingbird trap," she said to Erebus, who was trying to wake up and be friends again by rubbing his black glossy sides against her blue gown. "The little beauty dived so far down your great throat, thinking it was the calyx of a big red flower, when you stretched your mouth to yawn, that he escaped your sharp teeth altogether."

Then, picking from the terrace a white wax-like day lily she held it up before the little bird. The tiny creature turned his head gracefully, as if invigorated by the rich fragrance, then spread his shiny wings and darted away into the scarlet and yellow tangle of the honeysuckle vine.

For the few remaining weeks of summer we could tell him from the other hummers by a disarranged tail feather; and we called him Zip when he came on his morning visits and passed over the lily cups and the late petunias and geraniums, and we pleased ourselves by fancying that he cast intelligent, grateful glances at us between the sips of honey dew upon which he made his breakfasts.

As for our sly Erebus, he gave up lying in wait for hummingbirds, and removed his quarters to the shade of the butternut tree and took his morning naps there, in company with the shepherd dog Kris Kringle, and watches with him for more legitimate prey.

Those Confiding Quail.

LOS ANGELES, Cal., June 10.—*Editor Forest and Stream:* The quail about which I wrote you a few weeks ago has successfully hatched out her chicks. All but two of the eggs hatched. The interesting little family was seen about the house during one morning, and then they made their way down to the arroya at the foot of the hill, where small seeds abound.

About a week after the nesting of this pair they were reinforced by another pair, which built their nest just to the left of the front steps, also in a heliotrope bush. Notwithstanding the fact that the nest was within a couple of yards of where we are accustomed to sit on the broad veranda, she too successfully brought her setting to a happy termination and hatched out nine chicks, every egg proving fertile. We now have the two sets of empty shells, with the little caps still attached to some, as a memento of the confiding nature of the California Valley quail.

CULPEPPER.

The Copperhead.

Editor Forest and Stream:

I have just read Forked Deer's inquiry about the "copperhead" snake and your description of that reptile. From the latter I learn for the first time that I have some familiarity with the copperhead myself, though I was before unaware of the snake's identity.

The copperhead reminds one somewhat of the rattlesnake in general appearance, or perhaps because he inspires one with somewhat of the same kind of fascination when encountered in the woods, a quality which does not attach to any other snake with which I am acquainted. I have seen specimens of this snake in the hill portions of Mississippi, but never in the Mississippi River bottoms. The negroes call him the "rattlesnake's pilot," and aver that he is always followed by the rattler.

The copperhead has an abundant store of venomous fluid, as I have seen perhaps half a teaspoonful ejected upon the stock of my gun when pressed down upon the body of the snake near his neck.

The copperhead is also very pugnacious, which, in my experience, is unusual with venomous snakes. His congener, the cotton-mouth moccasin, cannot be provoked to strike except by hurting him.

The copperhead's fangs are much shorter than are those of the rattlesnake, and this is common to all the moccasin tribe, so far as I have observed.

About twenty years ago I came upon a copperhead while I was creeping through the woods after a squirrel that was barking a little distance away. When I discovered the snake I had placed one foot almost in contact with it—indeed, I supposed I had touched its body; but it remained motionless. I was unwilling to frighten my squirrel, and so I undertook to kill the snake by bringing the butt of my gun down on its head. The only effect of the blow was to electrify the snake into a great state of activity, and he began striking right and left with more vigor than definite purpose. After dispatching him I discovered that his eyes were opaque, and he was consequently quite blind, having recently sloughed his skin. I have seen specimens of this snake as much as 4 ft. long, and, like the rattlesnake, very large in proportion to length.

The copperhead is a very handsome snake, the ground color being almost ferruginous in intensity, and the pattern of the darker markings large.

I inclose two fangs of a rattler, killed about a month ago. The snake was 4½ ft. long, with nine rattles. These fangs are twins, having been both attached to the same base. They became separated in boiling the head to pieces.

It is quite rare in my experience to find a snake possessed of twin fangs, but I have encountered several specimens.

COAHOMA.

Game Bag and Gun.

IN JACKSON'S HOLE.

In Four Parts—Part Three.

THE morning of the 18th found us in the saddle at daylight. It was beginning to get interesting, and every fellow had his mind made up to secure a fine set of elk or moose horns to carry home with him. Ed, Cooke and Wester went in one party, and Will, Frank and I in another. We had not gone far, however, before I determined to take a hunt alone. Will and Frank wanted to go back to the place where they had killed the cow elk and see if the bears had been after the carcass. So we agreed to meet at a small lake we all knew in the evening, and with this understanding separated. I rode up one of the numerous cañons as far as my horse could travel, and when the ground got so rough that the horse could go no further I dismounted and took it on foot. I hunted hard until after 12 o'clock. I could see fresh sign almost every step and thought sure I would jump an elk after a while. I am satisfied that I was driving both elk and deer before me. Finally I gave up the chase and retraced my steps. I had been over the ground once, and thought there was no chance of starting anything. I was walking along carelessly, not even endeavoring to avoid stepping on twigs or making a noise, and had my rifle on my shoulder. I was not thinking about game and had started for camp. All at once I heard an elk give a shrill snort or whistle, and the next moment saw a large cow elk jump out of a thicket of quaking asp. She looked wild, held her head high in the air a moment, then gave a tremendous leap and was lost in the brush. I did not have time to get my rifle down from my shoulder and cock it before she was gone. I did feel mean. There I had been hunting all day, half the time with my rifle ready to shoot. I had followed one elk trail after another and had heard game running several times, and then on my way to camp started a fine elk and did not get a shot. I hastened to my horse and met the other boys at the lake. They had jumped one or two deer, but failed to get a shot also. We hurried on back to camp and found the other party there. Bob Cooke was the winner on this day. He had killed a large cow moose and had brought the usual portion, the hindquarters and one side of ribs, and old Ed had saved his tallow. We now had plenty of fresh meat in camp, so we erected a smoking rack and salted and smoked a lot of it. We consumed so much meat we thought we had better do this, as our hunting might not always be successful. In this dry and high atmosphere meat will keep in the month of September for two or three weeks without the least taint, so we did not make ourselves uneasy about running out.

We decided that night to send our guide Ed Trafton back to the settlement to get our mail and also to replenish our groceries. Next morning before day Ed had loaded two pack horses with venison, elk and moose meat and had his pockets full of letters for the post-office. He was to take a lot of meat to his family and then load the horses with our groceries on the return trip. It would take him three days to make the trip.

After Ed had gone we determined not to take any hard hunts until he returned, but to amuse ourselves with the antelope and chickens and fish, as Ed had promised us all the big game we wanted when he returned.

The 21st was Sunday, so we laid up and rested and told tales and had a big dinner and made ourselves as happy as possible. About 6 o'clock old Ed came riding in. He was hot and dusty and his horses covered with foam. He had started at 6 o'clock in the morning and had been in a

swinging trot and gallop every since. Only stopped one hour at noon. These Western horses have an unheard of amount of endurance. Forty miles of such travel would kill any horse in our State, to say nothing of eighty. We all received letters from home, besides bundles of papers; so we were a happy crowd. We had a big dinner that night in honor of old Ed, and he declared we were the best set of fellows he had ever been with.

The morning of the 22d daylight found all of us in the saddle. Sam and Bob hunted together, Ed and Will were together and Frank and I.

Frank and I hunted the rolling fir forests and around the edges of the numerous small lakes. We killed a black-tail deer together. We were walking along side by side when it jumped up and both fired almost at the same time. I saw the deer tumble and looked to see if Frank had fired, and saw his smoking gun in his hands. When we got up to the deer we found that both of us had put a bullet through her. It was a large doe. We put her on one of the horses and went back to camp. About dark the other boys got in. Bob Cooke was the winner again. He had killed two large bull elk and all the horses came in loaded. Old Ed was for saving his winter meat and tallow, and we were only too glad for him to have it. We otherwise could not possibly have used all the meat we killed. Bob had two nice sets of horns this time. Sam said he never saw a man do better shooting. Sam was on the opposite side of the cañon and saw Bob when he jumped the elk. There were five of them, and all bulls but one, and Bob killed two before they got away from him. That is what I call good shooting. When a man jumps a herd of elk and kills one as they run off at a rate of speed almost beyond conception, and the animals jumping logs and crashing through the brush, it is good work, but when he drops two of them it is just grand, that is the only word to express it. He shot one elk twice and the other three times, so you know he must be "chain lightning" with a rifle. We had a royal feast and drank the health of the Nimrod of the day.

Next morning, the 23d, all were in the saddle by daylight. Ed, Bob and Sam took three pack horses and went back to the cañon where Bob had killed the two bulls. They wanted to bring in more of the meat and Ed was particularly anxious for the tallow. Will, Frank and I went together. We hunted around the edges of the lakes and in the ridges and flat timber for a while, and finally struck a fresh elk trail leading up one of the largest cañons. We followed it as far as we could on horseback, and then dismounted and continued the pursuit on foot. We climbed over boulders and fallen trees and scrambled through quaking asp thickets and currant bushes until we almost tore our clothes off, and kept on and on until we were exhausted. It was a fresh trail and could not have been more than two or three hours old, as we could tell by the droppings. There were several tracks of unusual size in the herd, so we knew there were some old bulls along. We finally had to give up the chase for that day, however, and in returning killed two deer. Will killed the first mule deer we had killed on the trip, and I got a black-tail yearling. Both were killed running, of course, as you very rarely obtained a standing shot. We took only the hindquarters, as they were killed some distance from our horses.

When we got to camp we told old Ed about the trail and the big tracks and he told us to sleep well that night, as he was going to camp with us on that trail the next night or have some of those bighorns. He said that the bulls were getting ready to start to running and we would find some old fellows with that band.

We slept soundly that night and dreamed of bighorns and old bulls all night. Next morning by daybreak we were ready to start. Each man had two days' rations of bread, potatoes, onions and salt and bacon. We were going to lie out that night or find that band of elk. We also strapped our overcoats and one blanket to each saddle. All were moving by daybreak. It was about eight miles from our camp to the mouth of the cañon. There was a lake three or four miles long and about as wide in the mouth of the cañon; in fact, it extended up into the cañon for a mile or two. It was a wild-looking place and the scenery was beautiful, just like pictures I have seen of lakes in the Alps. The borders of the lake were so thick with matted vines and undergrowth that our progress was very slow. We toiled on for several hours and got well up into the cañon, and when it became so rough we could ride no longer we dismounted. We tethered our horses on the bank of the mountain stream which dashed down to the lake below. We intended to come back to our horses and camp that night. This was one of the widest and grandest cañons we had been in. It was fully a half mile wide from one bluff to the other. Through the center rushed a mountain cataract that foamed and boiled among the huge boulders in its bed. There were masses of rock scattered here and there, upheavals of earth, upturned and interwoven trees. The whole surface of the ground was a mass of huckleberry, currant and wild gooseberry bushes, intertwined with mountain laurel and ivy. I never saw such a crop of berries. The bushes were loaded, and every few steps we could see where the bears had been feeding on them. An old bear bends a bush down and usually breaks it, and never leaves it until it has stripped off every berry and usually a goodly quantity of the leaves. A bear will devastate a pretty good area of berry bushes in a few hours' feeding.

We now began to see numerous signs of both bear and elk. We knew that a big herd of elk were up in this cañon, as we had trailed them up the evening before. We now separated into pairs, with the understanding that we would rendezvous at our horses that night. We also agreed that no man was to fire his rifle at anything smaller than a deer. I claimed old Ed as my companion on that day's hunt. Ed was an expert in the art of finding game, and the man who hunted with him was almost certain of a shot at some large game. He wore moccasins like an Indian, and could walk as stealthily as a cat.

We all now started, divided into pairs; we were to hunt up the cañon. There were several pairs, and we were separated from each other some 200 or 300 yds., and all hunting parallel to each other. In this way we could hunt the cañon out thoroughly, and would be apt to drive game to each other. We were determined not to allow that fine herd of elk to get out of that cañon without getting one or more of those old bulls. We were hunting now for horns, and we knew that they were up in the cañon and have them we must. Ed and I traveled about

two miles up the cañon and kept finding fresh tracks and sign. We knew the herd was there and that we would run across them after a while. About this time we heard a rifle crack over to our left, then another, and another, until it broke into a regular fusillade. We knew the boys had got into elk, as there were too many shots for it to be deer. The deer in the Rocky Mountains do not run in large droves like elk. We kept on going, only watched more closely and kept our rifles ready. I was determined to down the first elk that showed his head, and not be chagrined as I had been once before. The cañon became very rough and walking was exceedingly laborious. We had to climb up and over great masses of stone, all covered with thick huckleberry and currant bushes, and then down into the bed of one crater after another. It seemed as if nature had made a retreat for the poor hunted beasts that defied mankind. We surely could not have gone much further up the cañon, as it was beginning to be one mass of boulders, and the undergrowth was so thick we often had to stop and cut our way through. We heard several more shots over to our left and knew the boys were still starting game. We were beginning to get pretty tired and hot when we heard a wild snort and the brush breaking. We both stopped, cocked our rifles and waited. We only had to wait for a moment, when we saw a large bull elk plunge out of the thicket and spring up the side of the steep declivity. It was about 100yds. distant and a splendid shot. Ed was below me on a hillside and did not see the bull as soon as I did. I took aim and fired, but just as I pulled the trigger the old fellow plunged behind a huge boulder and I thought he was gone. By the time I pumped another cartridge in my rifle, however, the old bull appeared again. This time I had a good shot. He was running broadside to me. I took more deliberate aim this time and drew at his foreshoulders. At the crack of the rifle he plunged forward and changed his course. Old Ed said a good shot. We will find him over yonder somewhere. Ed now turned down the cañon to head off the bull if possible, and I went to the spot the bull was when I fired. I soon found the blood trail and followed it. I had not gone more than 300yds. when I saw him. He was standing in a clump of fir trees and was looking right at me.

I realized that it was not safe for me to go too close to him; so when I got within 40yds. of him I stopped, and taking deliberate aim shot him through the head. That dropped him. Ed heard the shot, and realizing that I had overtaken and killed the bull he came to me. After the excitement was over I began to realize what I had done. I had killed the oldest and largest bull on the trip and had a magnificent set of horns. Ed estimated the weight of the bull at 800lbs. The horns had five prongs on each beam and both beams were exactly alike. I never saw a nicer matched pair of beams. They measured about 5ft. from tip to tip.

The killing power of the Winchester express rifle is tremendous, and I would advise every hunter who goes to the Rocky Mountains to have one, and to use the hollow-pointed bullet. We now set to work to skin the bull, and hung the hide, horns, tallow and both hams up in a tree, so the wolves and bears and thousands of small animals could not get it. We did not intend to try to get any of our meat out of the woods that day, as the distance and difficulties were too great to overcome.

We set out toward the places where we had heard the other shooting. After scrambling over rocks and breaking brush for about an hour we stopped and fired twice, the usual signal. We received an answer not far from us, and we went to the place. We found Sam Wester sitting on a log, and at his feet lay a large cow elk. He then took us to another place about 75yds. distant, and there lay a yearling elk. Sam related his experience in a few words. He was alone, as he had separated from Will McKamy shortly after starting. When he reached this place he started three elk—a very fine bull, a cow and a yearling. Sam was too greedy. He did fine shooting, as he killed the cow and yearling and wounded the bull before it got away. But alas! he lost that fine set of horns. Sam should have fired at nothing but the bull, and should have allowed the cow and calf to go. If he had done this he certainly would have killed the bull, for he is an excellent shot at both running and standing game. He took us to the spot where he shot the bull, and we could distinctly track him by the blood on the grass and bushes. We did try to trail him up, but soon lost the trail and had to abandon it. Sam was heaping reproaches on himself for allowing that fine set of horns to get away from him. We had to laugh at him. The idea of a man being so greedy as to want to kill all three of the poor beasts. We told him he did not deserve any sympathy. We now set to work to skin Sam's elk and hang up some of the meat and the hides, and then set out to find the other boys. It was not long before we found Will McKamy. Will was down on his knees skinning a big elk. He had got into a bunch of a dozen or more and had picked out the largest bull and killed it. He had a pretty good set of horns, but not like mine. We helped Will to finish his job of skinning and hanging up his trophies and meat, and then set out to find Frank and Bob. We finally located them after firing several signals.

When we reached Frank and Bob we found that they had another bull elk. They had it skinned and ready to take the horns and part of the meat to camp. Frank had killed it. Bob was unsuccessful on this our banner day's hunt.

We decided to take Frank's and Will's meat out of the cañon that night and go back to our main camp. Frank and Will went after the horses, and after considerable trouble we picked out a way for them and got the horses to the two carcasses. Now came the troublesome part of the day's work, getting the game out of the woods, and such woods. People who never saw a Rocky Mountain cañon cannot realize what the Grand Teton Cañon is, where we had our game down. We started after lunch. It was about 2 o'clock. After we had loaded three horses with the combined horns and hides and part of the meat of Frank's and Will's elk we started out of the cañon. Now came the rub. Of all the places on earth I never saw such a place as that cañon. We had to chop and cut at almost every step, as the bighorns would get hung in the thick bushes and vines. We also had to unstrap the loads and carry them by hand over the numerous glacier beds. These glacier beds are rough places, caused by snow and ice sliding down the sides of the cliffs and rolling huge stones and broken timber down into the cañon. When the snow and ice melts away it leaves a rough bed

of boulders the size of houses, and matted and broken timber. We were five hours getting the horses and their loads out of that place, but we finally accomplished it and rolled into camp about 9 o'clock that night. We were all worn out, but happy. The cook hustled around and got us up a hasty supper, and we ate, drank and were merry. Old Ed was happy. He had seen three of us get big sets of horns that day, and his supply of meat and tallow had been very largely increased.

A. B. WINGFIELD.

MY FIRST LARGE GAME.

EXPERIENCED sportsmen will probably detest many wrong ideas and mistakes I made in my first hunt; but they must remember that they are the ideas of a greenhorn and (probably) are not backed up by the experience of any guide or sportsman.

My friend Mr. C. invited me to go into the woods with him last year and I gladly accepted the invitation. He furnished all the camping outfit from his well-filled stores, even insisting on my taking one of his fine rifles that had a record of three moose.

I was on hand at the appointed time, and after many miles' ride in a canoe (my first one) and half as many more with a pack on my back, we arrived at camp just as darkness was shutting down. A few days' rest and getting the lay of the land and I was ready to try my luck. Our camp was about 100 rods from a small stream which was hardly navigable for a canoe, owing to the dry season. George, my guide, and I started down stream about 1 o'clock just to look the ground over. The stream was very winding and its banks for 200 to 300ft. back were covered with tall grass and alders and then thick woods beyond. As we rounded a point the stream, which here was 60ft. wide and quite deep, stretched out 500ft. ahead and then took a turn to the right. Across this expanse of water and back about 100ft. from the shore breast deep in the tall grass and alders stood the finest buck seen in these parts for twenty years (guide's own words). The sun, which was getting low, was in our backs and shone full upon the buck, who stood head on

THE PORTABLE CAMP AS LOADED ON THE CARS.

with a look of intense listening, his beautiful, heavy antlers reflecting in the sun, forming as handsome a picture as one could wish to see. My rifle ready cocked lay across my knees, which, owing to my sitting very low in the canoe, brought it within 1ft. of my shoulder. It took but a moment's time to line the sights and pull the trigger. I aimed at the base of the neck, as I could not see below there. The buck reared straight up and went over backwards, and the top of the alders shook as we paddled down the stream. We were paddling by the deer out in the middle of the stream and making for a point further down to find a good landing, when George said, "I am afraid he will get away." This was enough for me. I jumped to my feet, at the same time bringing my rifle to my shoulder, saw the deer staggering, took quick aim and bobbed down again just as the canoe was going over. The guide swore roundly at me and said, "You can't shoot that way, you almost upset the canoe; there is 6ft. of water and then 6ft. of mud here, and I can't swim a stroke." Well, we got ashore and found that the first shot had glanced on the neck bone and cut the jugular vein, and the second had passed through his neck near the body. As it was growing dark and we had a stream full of snags to get up, we left the deer and came for him in the morning. He had as fine a set of horns as one could wish, being nearly as large as a man's wrist at the base.

I had several chances to drop a deer later on, but as old Tim said, "You have as fine a buck's head as you will get if you come here twenty years," I did not care to shoot any merely for fun.

One morning, Mr. C. and his guide having left us for a few days, George and I started down stream at 6 o'clock. George said, "I want to go early and try my luck at calling." Now, George is not considered a professional moose caller, and was taken with our party because he was an excellent cook, but he proved better than we expected. We were out about an hour, and came to a stretch of dead water where George had several times remarked it would be a good place to call. George laid down his paddle and taking his birch bark horn gave two calls. We then paddled down stream 300 or 400yds. and called again. After waiting a while we paddled on. At the end of this dead water the stream narrowed to about 4ft. and took an abrupt turn to the left, leaving a long point of land covered with tall grass. As we neared the turn I heard what sounded to me like a horse walking very fast in the water. George said in a whisper, "That's a moose," and a moment later, "It's a big fellow, and he is charging right on to us. Be sure of your aim." I was all alert in a moment, but not the least "shaky." We had reached the turn in the stream and the prow of the canoe was pointed to the opposite bank, 4ft. away, so I had to turn half around to the left and look over the side of the canoe to command down stream. The grass was high on the point and I could not see 6ft. away. The splashing continued coming nearer and nearer, and I waited with

rifle at shoulder and my eye along the sights. George, who had been standing, was drawing himself down to keep out of sight of the moose, and he at last whispered, "Can't you see him?" I shook my head, not daring to answer. George forced the canoe suddenly ahead till it struck the opposite bank with a crash and told me to jump. He afterward told me he was frightened, and that he thought the moose would rush over us. It occurred to me that it was foolish to make so much noise when we had been keeping so still, but I had no time to think, for it brought me out to the end of the land where I could just see through the grass. The moose, which was charging ahead, stopped suddenly as he saw the outlines of the canoe through the grass, and before he realized his danger I had fired, aiming at the base of the neck. When I fired he vanished. I jumped to my feet to spring ashore to get another shot as the moose ran down the stream, but George yelled, "Sit down!" and being a greenhorn, I obeyed him. When he found he could not force the canoe around the point—the water was so shoal at this bend—he said: "Well, get ashore." One jump put me in command of the stream, but I would have been too late had my first shot not proved fatal. The moose lay 200ft. down stream with his head under water and his legs pounding the muddy surface. Soon George worked his canoe around the point and we managed by ropes and trees to drag our prize on to a low place. The bullet, a .45-70, had struck him in the soft part of the base of the neck and passed through to his hip. He weighed about 1,000lbs., was about 6 years old, and had a very handsome hide, but a poor pair of antlers. The hide and horns now grace my billiard room, while the handsome deer head adorns my dining room.

I would like to tell you of the game Mr. C. brought down. Of the large black bear he shot which thrust its head out of the tall grass nearly into the canoe one dark night as Mr. C. was paddling up the stream, and of the beautiful double shot he made, bringing down two fine caribou decked out with handsome horns a yard long. But as I started to give the experience of a greenhorn, I will stop at that.

E. N. WINSLOW.

A Portable Camp.

LA CONIA, N. H.—*Editor Forest and Stream:* A few weeks since we noticed in the columns of your paper an article relative to our hunting outfit, now at Parlin Pond, Maine.

Thinking that perhaps it might be of interest to yourself and some of your readers we send you a photograph of the camp loaded on a flat car for transportation.

The camp is on wheels having 6in. tires, and is also provided with runners which can be clamped to the wheels for use on snow. The running gear was built by Messrs. Abbott-Downing Co., Concord, N. H., while the body was built by a local car builder. The body is 16ft. long by 8ft. wide, inside measurements; is provided with four berths having air mattresses and pillows, a cook stove, cupboard, refrigerator, sink, tables, and below the body of the wagon, between the wheels, is a cold storage where the provisions and supplies are stored, the entrance to which is effected through a trap door in the floor of the camp. Under the back platform of the camp and back of the rear wheels is another closet in which are kept the tools for use in cases of emergency, such as axes, hammers, wrenches, ropes, etc., while on the top of the camp is an arrangement by which a canoe can be fastened and taken along, although it is not shown in the photograph.

The camp is double sheathed throughout, is lined with tarred paper between the sheathing and is as warm and comfortable as our own houses at home. The inside is finished in the natural wood, while the outside is painted a dark olive, as near the color of the foliage as was possible to get it.

The entire equipment, canoe and everything, weighs 6,015lbs. and can be drawn anywhere by four good horses, providing the road is not too rough.

Both the doors and the windows to the camp are provided with shutters, which can be closed from the inside whenever it is desirable to do so.

The camp was designed and built in Laconia, N. H., last fall by Frank E. Busiel and William Esty, of this place, was placed aboard the cars in the latter part of November and shipped to Jackman, Me., where it was unloaded and drawn to Parlin Pond, Me.

FRANK E. BUSIEL.
WILLIAM ESTY.

Iowa Game Items.

NEVADA, Iowa, June 9.—While we have had a great deal of rain in Iowa this spring it has come down mostly in the form of warm, steady showers, and has not injured the eggs or young of the prairie chickens. I have already heard of young chickens being seen, and the prospects are fine for a "big crop" of the birds.

Fishing in the lakes of northern Iowa is reported fine. Large catches have been reported from Spirit, Okoboji, Clear and other lakes. Mud or Cairo Lake, in Hamilton county, once a famous ducking place, but which was ditched and drained two years ago and partly farmed last year, is full of water again, and the boys are rejoicing at the prospect of some duck shooting next fall.

Uncle Charley Bryant was in the store to-day and informed me that several days ago he caught a litter of eleven wolf pups near his place, northeast of this city. He says they were a cross between the prairie and timber wolf, and Uncle Charley ought to know, as he has been in the wolf business a good many years. He manages to get a litter of wolf pups nearly every spring, but this was the largest litter he ever caught in this State. He told me that he had holed up two other litters this spring, but as he has a lame hand he could not dig them out alone, and while he had gone for help they escaped. The bounty for wolf scalps is \$2 each, and the neighbors say Uncle Charley pays his taxes every spring with wolf scalps.

J. C. BRIGGS.

A Ducking Incident.

ASHLAND, Wis.—Time, daybreak, Sept. 1. Location, wild rice meadow, channels of clear deep water meandering through. A birch bark canoe, Indian in stern, white man in bow. Indian noiselessly paddling canoe toward the crimson light in the east.

Some wood ducks spring from a fringe of willows at the edge of the channel. Bang. One dead bird. Click goes gun; fresh shell shoved in. Click again. More

silent paddling. Two teal jump up and go skimming away, straight ahead. Bang, bang! Two dead birds. Retrieve. Slip quietly along again. Big mallard springs up almost under bow of boat. Bang, miss, cover with left and bang again. Some feathers drifting in the morning breeze. Big splash. Dead mallard.

Sun comes up. White man hungry. Looks back at Indian, says "camp." Indian turns canoe paddles half-way across channel. Duck jumps up at edge of rice in front. Swings to the left. White man screws around, duck swings still more to the left. White man screws around still more, covers and pulls. Bang! Two big splashes, canoe bottom up. White man with arm over canoe. Looks back; sees bubbles, dead ducks and paddle bob up. Indian bobs up. Catches hold of canoe. White man feels water running down inside shirt collar. Says "ough." Indian makes no sound, but looks all around. Sees big pine tree in edge of rice, about ten rods away; looks at white man; jerks head toward tree. White man and Indian swim and shove canoe to tree. Climb up. Pull up canoe and empty out water. Gather up ducks. Both paddle, and canoe hums through water to camp. Big fire. Indian still silent. White man fixes two tin cups full of hot water and something else hot. Hands one cup to Indian. A moment's silence. Two empty cups. Indian speaks. "Ugh! Think like to go out tip over again!"

GEO. W. MIARS.

CHICAGO AND THE WEST.

CHICAGO, Ill., June 20.—The Kewaunee case, the *cause celebre* in Western protective matters, "drags, like a snake, its wounded length along." It was expected that Judge Bigelow, before whom the motion for new trial in the confiscation proceedings came up, would before this have passed on the motion; but he has not as yet done so. It is very possible that he feels himself in an awkward judicial position, and realizes that he may have been wrong in his first position. He has asked to refer the case to a second circuit judge, who has declined the honor. Attorney Ladd, for the sportsmen, writes this week that he believes that it would be as well to take the case direct to the Supreme Court of the State, but is not clear how this can be done over the head of the Circuit Court before which this motion is pending. Meantime the "people's case," taking up the criminal side of the Merritt freezer question, is to come up before the Appellate Court early this fall. The court will determine the question of the illegality of having in possession game killed in other States. This question comes up also in the confiscation or property side of the case, and it is possible that Judge Bigelow would not be adverse to getting a line on this question of law from the Appellate Court. Should the latter court favor the sportsmen in its decision, and should the Circuit Court incline to the same position, the sportsmen would have nothing left to ask and nothing to be decided except the right to seize the illegal game. This would take the matter to the Supreme Court in very good shape. It must probably go there finally in any event, and in the meantime these tedious legal delays constitute practically the whole amount of the news of the matter. The case is a very important one, and should the sportsmen eventually win it, it will break the back of the cold storage game outrages in the West.

The Texas Buffalo Herd.

Telegraphic news comes this week that the mysterious Texas buffalo herd, known as the Val Verde herd, has been again located, and at last accounts a party of cow punchers had been sent out by the rancher who intends to round up the herd and confine it in his ranch pasture.

Italian Joe.

Readers of FOREST AND STREAM may perhaps remember that unique character, Italian Joe, the plover shooter. Joe tells me that he now has a little place of his own out on the edge of the Chicago plover country, I think he said at Archer road and Fifty-fifth street. He invites me to come out next September, and says that we will certainly have a good time with the golden plover then. Joe says that he had very fair plover shooting this spring. His favorite ground lies on the ground of the natural flight of the snipe and plover, which I have earlier mentioned as lying between Chicago and the Fox River. This is a high, rich farming country of black land interspersed with sloughs and waterways.

Bears in the Big Hole.

Curt Harrison, a Montana hunter, is reported to have killed three bears in the Big Hole basin last week—one grizzly, one silver tip, and one black bear. The grizzly is said to have weighed over 500lbs.

The Biggest Bighorn.

June 13.—The biggest bighorn head in the world, so far as is known authentically at this time, hangs to-day in the Western office of FOREST AND STREAM, having just been received from the hands of the taxidermist, Thomas W. Fraine, of Rochester, N. Y. Mr. Fraine has spent some weeks in modeling this head and has consulted all sources of information, referring to photographs and recorded measurements, as well as consulting with the best authorities on big game in the country, and making studies from such live mountain sheep as he could find in the parks. The specimen in question was worthy of all the care and patience it received, for the like of it is thought not to exist to-day, this being the verdict of the most experienced big-game shooters who have seen the head, both in New York and Chicago.

The thanks of FOREST AND STREAM are certainly due to the donor of so magnificent a specimen. As was mentioned in the report of the Sportsmen's Exposition in March, the killer and donor of the head was Mr. William Jackson, of Piegan, Mont., who will be remembered pleasantly by so many who saw him at the FOREST AND STREAM camp of the red hunter. "Billy" Jackson will be glad to know that the great head in which he took so much pride has had proper attention and has safely arrived at the abiding place which he selected for it. It has already been seen by a number of the sportsmen here who have marveled at it, and it speaks eloquently of the noble sport still to be had in some of the wildest corners of the Rocky Mountains. There is no prouder or gamier looking animal than the Rocky Mountain bighorn, and the face of this scarred and battered old veteran retains the melancholy but bold and fearless expression of his kind. The head has been voted the choicest possession of

the FOREST AND STREAM office here. As considerable scientific interest attaches to this specimen, I shall later have proper measurements made by an authority on such matters, and confidently believe that we shall then be in a position to ask competitors to bring on their big sheep.

To the Rockies.

Mr. Alfred Weed, of Anderson, Ind., inventor of the Weed perforated bullet, made this office a pleasant call this week. Mr. Weed purposes taking a trip for big game into the Rockies this fall, probably into the Jackson's Hole country. He has killed all the big game of the East in Maine and Canada, but is shy an elk and a grizzly or so. The latter, I am disposed to think, he will come pretty near getting if he lodges one of his flat-headed, stove-pipe bullets in any ticklish part of his anatomy. Mr. Weed tells me that Mr. Archibald Rogers killed two grizzlies on one day, using these cylindrical bullets, whose effect he described as being extremely destructive.

A Folk-Lore Meeting.

A meeting of the International Folk-Lore Association was held yesterday evening at the residence of Mrs. J. Y. Scammon, of this city. Professor Starr, of the Chicago University, gave an interesting talk on the sun dance of the Indians. A number of Sioux Indians from Buffalo Bill's Wild West show were present at the meeting. An association seal was adopted indicating the purpose of the body, which is the study of Indian traditions and myths.

Babies in the Park.

At Lincoln Park, in this city, a mountain lioness has given birth to three cubs, which are flourishing very well at this writing. The park also has a pair of baby leopards, which are now two months old.

Crawfish and Jacksnipe.

A friend living in the South gives me a curious bit of information about the "crawfish lands" of his country, meaning lands in which the crawfish bore their holes. He says that this land raises better cotton than any other, the stalks reaching great height on such soil. A Northern friend, joining in the same conversation, called attention to the fact that though in the North the crawfish land is not held valuable, it is always the ground where one will find the most jacksnipe.

The Daily Reporter.

My friend, the daily reporter, has again gotten mixed up with firearms. In describing a recent murder he says, "The murderer was heard shambling about the house, but it was not suspected he was priming his revolver." Probably he wasn't. Any really up-to-date murderer hardly uses a revolver which has to be primed, and indeed he might find difficulty in finding such an arm.

The Game of Alaska.

I continue to notice in the Pacific coast papers reports of the resources in big game of the recently developed gold country along the Yukon in Alaska. It would seem that moose and caribou are very abundant, and that anyone who wants his grizzly can get him without any trouble. A recent writer speaks of a breed of grizzlies known as the Mount St. Elias bears, which he says are fighters from the drop of the hat. The usual custom of mining camps will be followed no doubt, and much of the game immediately around the gold fields will be killed off, but this will only mean a better acquaintance with the country for the sportsmen's travel which is bound to go to that country before very long. E. HOUGH.

1206 BOYCE BUILDING, Chicago.

In the Mountains.

RED LODGE, Mont., June 13.—*Editor Forest and Stream:* I shall be located in the game country in Montana and Wyoming for the next four months. The latch string you will always find on the outside of the tent should any of the FOREST AND STREAM family come this way. If any brother sportsmen contemplate a trip to this section and will communicate with me I will give them valuable information as to outfitting, etc., from here.

Wednesday last I rode over to Clark's Fork Cañon and I found it as beautiful as ever. In fact, I believe it grows more beautiful each time I see it. The fishing was poor in Clark's Fork owing to very high and muddy water, though in the Little Rocky and Bennett creeks the fishing is excellent.

There is much rivalry among the outfitters here this season. Like all other outfitting towns, there are guides and men who call themselves guides, and it is difficult for the uninitiated to decide which is the guide. I am on the ground and will cheerfully give any information possible to help out. There is still much snow up in the mountains, though the hot sun of the past three days has cleared many places. Will report all along the line of march. WABASH.

Chinese Pheasants in Kansas.

TOPEKA, Kan., June 20.—*Editor Forest and Stream:* The introduction of the Chinese golden pheasant into this section of the country may be credited to Hon. A. B. Quinton, a prominent lawyer of Topeka, who last year procured a pair of birds from H. T. Hudson, president of the H. T. Hudson Arms Co., of Portland, Ore. The pair survived and are in good condition, and last May Mr. Quinton received from Mr. Hudson eighteen eggs, out of which were hatched fourteen chicks, four of the eggs being broken. The chicks are lively and doing well, and will be kept in confinement until next spring, when they will be turned down some miles out from town upon a large farm where hunting is not allowed, where it is hoped they will thrive and multiply.

The introduction of this splendid game bird into Kansas is a matter of great importance to the shooting fraternity, and the experiment is being watched with much interest by our local sportsmen. A. J. HAWKER.

Game Laws in Brief.

THE *Game Laws in Brief*, current edition, sold everywhere, has new game and fish laws for more than thirty of the States. It covers the entire country, is carefully prepared, and gives all that shooters and anglers require. See advertisement.

Sea and River Fishing.

HE CAUGHT A HUNDRED TROUT.

BY FRED MATHER.

I MET him at the station door,
With rod and well-filled reel,
And as he stepped to earth once more
Most happy he did feel.
He ope'd his eyes and rubbed his head,
And smiled and gazed about;
Then winked at me and slowly said:
"I caught a hundred trout."

"A hundred trout!" I cried. "O, dear!
Where have you been, I pray,
While I've been chained to business here
And could not get away?
Has pussy-willow dropped her-blow?
Is the dogwood blossom out?"
He only said: "I do not know;
I caught a hundred trout."

"How clear has been the thrush's note?
How often have you seen
The May fly on the water float,
With wings of changing sheen,
Leaving her thin, transparent shell,
Rejoicing that she's out?"
He only said: "The fish bit well;
I caught a hundred trout."

A hundred trout! O, deary me!
And I am tied down here!
What weeks of work I'd give to see
The brook, the wood, the mere!
There's a moral hid somewhere in this,
But I can't find it out;
I only know to me 'tis bliss
To take a dozen trout.

MEN I HAVE FISHED WITH.

AFTER reading an English book entitled "My Life as an Angler," by Mr. Henderson, a friend who had heard some of my fishing stories in many parts of this continent, and abroad, with gentlemen, loafers, Indians and niggers, suggested that I write up these many-sided people in an anecdotal, historical and semi-biographical sort of way for FOREST AND STREAM.

In this scheme Mr. Henderson's arrangement will be reversed, just as an inventor turns a machine upside down and gets a patent for an original device. The sketches will incidentally contain all that is covered in Mr. Henderson's title, but that is a natural sequence of the title which I have chosen; yet the foreground will be filled with the main people in the cast, each being the star of the evening.

This series of articles will cover over half a century, and most of the actors are dead, and in some cases I know little of their lives, and will be very glad to get any anecdotes, biographical sketches or even obituary notes of them. The following is a partial list of the persons with whom I have fished and will write up, and among them will be found a few who are still living, and I hope fishing, whose consent may not have been fully given, but who will not bring suit for defamation of character until they read what has been said of them. The list is given by decades:

1840. Reuben Wood, John Atwood, Billy Bishop and Port Tyler, all of Greenbush, N. Y.; Geo. W. Simpkins, Warrensburg, N. Y.

1850. George Dawson and Ira Wood, Albany, N. Y.; Charles Guyon, Potosi, Wis.; Antoine Gardapee, a Wisconsin trapper; George H. Raynor, Chicago, Ill.; Wet Dog and Dirty Face, Ojibwa Indians; William Warren, Kansas.

1860. Gen. Chester A. Arthur and Francis Endicott, New York city; Mortimer Locke, Honeoye Falls, N. Y.; Seth Green, Rochester, N. Y.

1870. The Grand Duke Alexis, of Russia, in Currituck Sound; Hon. George Clark, Ecorse, Mich.; Hon. James Geddes, Syracuse, N. Y.; E. Z. C. Judson (Ned Buntline), Eagle's Nest, Adirondacks; Len. Jewell, Bay City, Mich.; Admiral George John Malcolm (H. B. M. Navy), at Freiburg, in Baden; Prof. James W. Milner, Waukegan, Ill.; Thaddeus Norris, Philadelphia; Franklin Satterthwaite, Newark, N. J.; George W. Sears (Nessmuk), in Adirondacks; Genio C. Scott, New York city; Prof. Spencer F. Baird, Washington, D. C.; Rear-Admiral L. A. Beardslee (Piseco), on Cape Cod and in Adirondacks; Delaware Bradby, or Bradly, a Pamunkey Indian, in Virginia; Joe, a darky boy, in Bermuda; Fred. E. Jones, Pike county, Pa.; Pete, a darky, of Tangipahoa, La.

1880. Wallace E. Blackford and Hon. Eugene G. Blackford, Brooklyn, N. Y.; John J. Flanagan, Utica, N. Y.; Jack Sheppard, an Adirondack guide; Col. Locke W. Winchester, New York city; Rev. Henry L. Ziegenfuss, Poughkeepsie, N. Y.; Hon. Amos J. Cummings, M. C., New York city; Castalia Club, Castalia Springs, Ohio; Alvah Dunning, Adirondack guide; Dr. Bashford Dean, Ph.D., Columbia College, N. Y.; Herr Max von dem Borne, in Germany; and several other men of note, who will be written of as anglers, with whom I have had the pleasure of fishing either as boy or man.

Many of those with whom I have fished were but little known to me at the time, yet there remain many memories of their personal traits as developed on one or more fishing trips, where a man will show more of his individual traits in a day than in a year's acquaintance in business. Hence my appeal for such notes as may relate to subjects of my proposed sketches. FRED MATHER.

Dynamiters in Massachusetts.

MILLBURY, Mass.—In this vicinity there is work for the Commissioners on account of the use of dynamite in the ponds. Singletary Lake and Dorothy Pond have been dynamited, and after picking up what fish were wanted the rest are left all along the edges of the pond.

Lou Clapp and Touch Wright caught the best string of pickerel seen this year in Singletary last week, the largest weighing 3½lbs. G. E. P.

EMERY DAVIS POTTER.

BY J. E. GUNCKEL.

[Read before the American Fisheries Society.]

A BIOGRAPHICAL sketch is probably the least interesting of any subject that could possibly be presented to a society the aim and object of which is the consideration of the propagation and protection of fish, but if you will bear with me for a very few minutes I will present to your attention a subject that will excite your interest and command your appreciation. By request I am to speak to you of a man whose name has been familiarly known throughout the United States, and intimately known to many of us for nearly half a century. As a member of this Society and as fish commissioner of Ohio for many years, no person took a greater personal interest in the propagation and distribution of fish. From the first experiments, in 1853, of artificial breeding of trout, when he was intimately associated with the late Dr. Theodatus Garlick, to the time of his death in 1896, he was a faithful advocate of the objects of this Society. I would like to invite your attention to a brief memorial touching the life history of our esteemed companion, showing his relationship to the interests of this association, and what we learn from the lessons so patiently taught us for nearly a century.

Some of the most distinguished men of the country have paid the highest tribute to his memory. Men of national reputation have paid homage to his worth and expressed their admiration of his many virtues.

Emery Davis Potter was born in Providence, R. I., Oct. 7, 1804, and died Feb. 12, 1896, in the 92d year of his age. The family removed to Otsego county, N. Y., in 1806. Like most of the early pioneers of our country, he devoted his leisure hours to studying such books as fell by chance into his possession, and during the winter he attended the public schools, receiving such instruction in the branches of learning as were taught in those days. After many years of hard, earnest labor he entered the law office of John A. Dix, at Cooperstown, N. Y. Mr. Dix was subsequently governor of New York; later United States Senator from that State, and Secretary of the Treasury. Completing his studies, Mr. Potter was admitted to practice in New York, but soon decided to make his home in the West. He arrived at Toledo, O., in the winter of 1834. His qualities as a lawyer and his high standing among the people were appreciated, and in 1838 he was postmaster in Toledo. In 1839 he was elected by the Legislature as presiding judge of the Common Pleas Court of the Thirteenth Judicial District, covering all of north-western Ohio.

Many interesting experiences he delighted to repeat in later years relative to his traveling from county to county on horseback, through dense wilderness, and how in the absence of bridges he was compelled to swim streams and resort to methods wholly unknown to the present generation in the same section. Wild animals roamed at will in the forest; the streams were filled with fish and in such vast quantities he often selected the size and kind desired in advance of biting. In 1843 he was elected a member of Congress from a district embracing ten counties. In Congress he at once took a prominent position which laid the foundation for his great interest in fish and fishing for the welfare and happiness of mankind, which followed him through the remaining years of his eventful life. He served with John Quincy Adams on the select committee on the Smithsonian will, which led to the founding of the Smithsonian Institute, now one of the most valuable and interesting institutions in the world. In 1847 we find him mayor of the city of Toledo, and during this year he was elected to the Ohio Legislature. In 1848 he was elected to the Thirty-first Congress, where he took a specially prominent part in the long struggle for speaker, receiving within three votes of being elected to that office. He was made chairman on the committee of post offices and post roads, and as such was the author of the bill providing for cheap postage and the coining of the 3-cent silver piece. Of this he said: "Speaker Cobb made me chairman of the committee of post offices. During my first term in Congress postage was reduced from 18, 12, 10 and 6 cents, according to distance. It was 10 cents for a single sheet to any part of the country. I had been corresponding with Sir Rowland Hill and was convinced that the rates of postage could be reduced in this country without incurring debt. I introduced a bill reducing the postage to 3 cents, a uniform rate for all distances in the United States. I was deeply interested. The main objections came from Senator Toombs, a distinguished and polished gentleman, whose principal objection was that we had no money, no change less than a 5-cent piece. I knew I had to do something to offset this plea, so I went to the mint and told them I wanted a 3-cent coin made. They sent me 300 or 400 of the little silver pieces, so I had my pockets full when Mr. Toombs was ready to make his final speech against me. I walked over to his seat just before he was ready and I said: 'So you've got no change less than 5-cent pieces, how do you like this for postage?' I pulled out a handful of the silver 3-cent pieces, and as he surveyed them carefully he replied, good-naturedly, 'I'll give up, you have conquered.' He voted for the bill. I afterward got the 3-cent pieces authorized by the Government."

It was in 1853 that Mr. Potter became first interested in the artificial breeding of fish. The successful experiments were made by Dr. Theodatus Garlick and Mr. Potter, and from that time to his death he devoted his leisure in the study and work of this interesting subject.

In 1857 he was appointed judge of the Federal Court of Utah, but declined the honor. In 1859 he was appointed collector of customs for the Toledo district, serving until 1861. He was elected as Senator to the Ohio Legislature in 1873, serving until 1875. It was during this term that Mr. Potter founded the law providing, at the expense of the State, for the propagation of fish in Ohio. To his personal attention and good management the successful introduction and establishment of that policy by the State was largely due. He was a member of the Ohio State Fish Commission for as many years as he thought he could be of service to the State and people. No man took greater delight in personally watching the many changing conditions of the millions of eggs hatched out in the different hatcheries of Ohio, or greater interest in distributing small fish in the inland streams and rivers.

In addition to the national offices held by him he was at various times a member of the common council, city solicitor, member of the board of education of the city of Toledo, and there was not a fishing or hunting club

organized in Toledo but what he was asked to hold some office, and was president of one association for over twenty-five years. Such part of his time as was not occupied by his business was passed in the society of men whose acquaintance was sufficient proof of the esteem in which his talents were held, and the friendship of such men was ample evidence of his moral worth. His amiable temper, agreeable manner and unaffected benevolence inspired all who knew him with esteem and regard. He was one of the most enthusiastic and successful anglers of our times. At the green old age of 90 he could bring to his net the gamiest black bass known in the rapidly flowing streams of our Western country, and he had that sweet and amiable disposition characteristic of all true anglers that, whether fish were wont to take his lure or not, he considered that "No recreation was so harmless and which had so many rational inducements to health and true enjoyment as angling." After a tedious winter's session of Congress he and Daniel Webster found relief in angling for salmon in the Kennebec and trout in the various streams of Massachusetts. He was a companion of John Quincy Adams and Henry Clay, and sat at the bedside of the great Kentuckian when his spirit took its flight. He was a life-long companion of the late Chief Justice Waite and Allen G. Thurman.

The unselfishness of his life was most remarkable. There are different degrees of unselfishness. There are good men who are willing to devote themselves to a great cause if they may choose the part of the work that suits them; Mr. Potter had no choice. All that he asked was that the service was needed. No life can have a loftier purpose than his. His genial sympathy and good nature attracted every person and every interest of the whole community. No consciousness of high political honors lifted him above his neighbors. A great man is always greater than any one of his actions.

The object of the American Fisheries Society is to devise means to restore to the lakes, rivers and streams in this country the food fish supply. The members by study, by experiment and intercourse with each other learned the best methods of fishculture, and by the skill which they have now acquired are able to bring into the world, by artificial means, more young fish than nature can in its ordinary course supply. Had it not been for the members of this Society the fish industries of the great fresh-

EMERY DAVIS POTTER.

water bodies, as well as the game fish for sport in the rivers and streams, would by this time be entirely demoralized, if not destroyed. Mr. Potter and Dr. Garlick watched with eager eyes the first spawn gathered in a rude box, and the result is better told by referring to Mr. Potter's address before this Society, at Put-in-Bay, in 1890, where he says: "About the latter part of January the eyes appeared in the eggs, and about March 1, 1854, there lay prone on his side on his gravely bed the first baby fish artificially propagated on this continent." From this experiment has arisen an industry the benefits of which have been realized by every civilized nation of the earth. The question had attracted the attention of fishermen and the ablest scientists in America and Europe. This was the beginning of his active interest in the propagation of fish. He saw with feelings of the deepest regret that each year the hand of commerce was advancing across the waters of the great lakes, and miles and miles of netting with its destructive tentacles extending in every direction, that in a few years our lakes and streams would be mere watery wastes. How true were his predictions we all know.

In 1871 he appeared before the General Assembly of Ohio. "Gentlemen," he said, "you have but one question to consider: Shall the fish and game be destroyed from the face of the earth by indiscriminate slaughter, or shall wholesome laws be enacted, so that the future generations may share in their products? Our lakes, our rivers and our lands are the nation's wealth. The earth only produces her fruits by careful husbandry. Shall we neglect our waters, the great source of our riches, for the want of an economical husbandry, or shall we let them become a barren waste, when abundance awaits an intelligent cultivation under judicious and wholesome laws?"

His interest never wavered in watching the protection of fish and game.

Anent his first experience in "the gentle art" of angling I quote from a manuscript penned by Mr. Potter for my use when he was in his 90th year: "When I was 16 years of age," he writes, "not liking farming very well, I made up my mind to go a-fishing to sea. I had a colt on the farm called my own, although I had never invested any money in it. This I sold, and with the money I started for New York. Arriving at Albany, for the sake of economy I took passage on a lumber sloop. Down about West Point we were becalmed and laid to. After dark, it being very warm weather, the table was set in the cabin, with the windows open and the lamp lighted. We were all seated around the table, when all at once a huge sturgeon bounded through the window upon the table, scattering dishes and supper in every direction. He took complete possession of the cabin, much to my enjoy-

ment. We soon dragged him on deck, and for the rest of the voyage had plenty of what the captain called 'Albany beef.' Not finding a ship in New York, I worked my way to Boston, where I found at Long Wharf a vessel just fitted out and ready to sail for the banks of Newfoundland on a codfishing voyage. This was just what I wanted. I had caught speckled trout in all the mountain streams of New York, and I lached for a taste of the gentle art at sea. I got it. I found before the season was over that the gentle art had lost its romance in codfishing off the banks, and oh! how I longed for the speckled trout in the clear streams of my native home."

At the age of 91 Mr. Potter penned me the following interesting sketch: "I am often asked what has been the cause of my robust health. I can best answer by giving my manner of life from the beginning. From my early childhood I fished the cold streams of Herkimer and Otsego counties for the speckled trout with an alder pole, with chalk line and angle worms, and passing through all the gradations of the art up to the rod and reel, with a book of selected flies. For over fifty years scarcely a summer has passed that I have not spent several weeks on the north shore of Lake Superior among the trout and bass, taking in all the favorite fishing grounds from the Soo to Fort William, including the famous Nipigon. My profession being a lawyer (I was the first lawyer that hung out a shingle in Toledo) required close application to office work, but in the fishing season on every Saturday morning before breakfast I took my fishing traps and spent the entire day, taking neither food nor liquors of any kind till my return home in the evening. My Saturday's respite from office labor I continued for nearly sixty years. I can say without boasting, although nearly 100 years old, that I see well, hear well, feed well, digest well and sleep well and without any organic impairment, and can keep with my bird dogs afield from morning until night. I will say for the young people—and knowingly too—that there is no sport that brings a person so closely into contact with nature at her best as angling. It first charms and then makes the art recreation. It leads you into the woods, where you are delighted with new scenes and sweet sounds; it gives you ample exercise for every muscle of your body. The music of the mountain brook, the cool air from the mossy cascade, the scent of wild flowers and rare ferns and the most perfect picture of woodland beauty are all the fortunate heritage of that happy man who goes a-fishing."

ANGLING NOTES.

Fly-Fishing for Tarpon.

WITHIN the past year I mentioned in this column that Dr. Wm. H. Drummond, of Montreal, had taken a tarpon on a fly in Jamaica, but my file of FOREST AND STREAM is not at hand at this moment and I cannot recall the circumstances of the capture.

Dr. Drummond has, however, recently returned from another visit to Jamaica, and while there devoted some little time to fishing, about which he writes me as follows: "In six days' fishing in Jamaica I caught over 150 tarpon in fly-fishing, fish from 2 or 3 lbs. up to 7 lbs., the average, I suppose, being about 2½ or 3 lbs. Such perfect devils when hooked I never met. I was almost afraid of them. They come at you like tigers and take fly or bait right into the air as they leap, and if your rod tip is at the wrong angle, bang! she goes. I broke three or four rods, including a 'steel' that I thought would stand anything. I also fished two days for 'mountain mullet,' which they say closely resemble our trout in everything but color, being of a peculiar bluish tint, but failed to catch one. In fact I did not see a mullet out of the water." As Dr. Drummond is president of the St. Maurice Club in Canada, he means the common brook trout when he says the mullet of Jamaica is said to resemble our trout, but I have no idea what the fish really is. Tarpon on the artificial fly, even if the fish weigh but 2½ or 3 lbs., must be sport a notch or two above bigger tarpon on a short stiff rod, and if anglers come from Europe to catch tarpon in Florida and Texas waters they will next go on to Jamaica for tarpon on the fly rod.

Growth of Trout Fry.

At the meeting of the American Fisheries Society, when one of the papers was being discussed by the members, the growth of brook trout was referred to, and all admitted that Long Island waters produced trout of greater size at the same age than any other waters.

I had just planted a lot of yearling trout that were 9 in. in length, that were reared at the Cold Spring Harbor Station of the Fisheries, Game and Forest Commission, and they were not fish that had been specially fed. Commissioner Thompson told of yearlings of even greater size in the ponds of a private club, of which he is the president, on Long Island. When I returned home I found a letter from Mr. C. C. Wood, superintendent of the Plymouth Rock Trout Co., in which he said: "I am sending you specimens of our brook trout fry hatched in January last, which will interest you. They are not the largest individual fish we could select, but a fair average of our oldest fry." They were fry that any fish breeder might well be proud of, and I measured one over and found it 1½ in. long. I then wrote to Foreman C. H. Walters to send me specimens of his January fry from the Cold Spring Harbor Station of the Fisheries, Game and Forest Commission of New York. He writes: "I send a fair sample of our trout fry. I could send larger ones, but you say you want an average lot. These were hatched about the middle of January. You know we did not keep the first fry that hatched, but sent them away to fill applications, as the rearing ponds were not then ready for them." These trout will average about 2½ in. in length, but one of them is 2½ in. long.

I asked Commissioner Thompson to send me specimens from his club waters, and while they vary more in size than the others, one of them is full 3 in. long, and the shortest one is 2½ in. in length. The three lots of fry were all well conditioned fish, those from Commissioner Thompson being especially deep in the body for the length. At his club he feeds no liver. Minnows are procured and the flesh peeled from the bones by steam, and the flesh is then fed. I am very glad to testify to the size of the fry of this year's growth sent to me by Mr. Thompson, for during the discussion at the American Fisheries Society meeting at the New York Aquarium, where Mr. Thompson said he had fry of this year that were 3 in. long, an expression of mine, as I afterward read it in the stenographer's minutes, expressed surprise

at the statement not warranted by my feeling. It was because I did not clearly understand his remarks that I asked if his fry were 3in. long.

Steelhead Trout.

The steelhead trout fry recently planted in New York waters by the Fisheries, Game and Forest Commission were raised from eggs sent by the U. S. Fish Commission from the Hoopa Valley station in California, now in charge of Capt. Wm. E. Dougherty, United States Army. Capt. Dougherty writes me about the fish as follows: "I am not able to give you any authentic instance in which it can be shown that the steelhead has spawned and reared young in fresh water without going to the ocean first. But it must be remembered that very little scientific inquiry has been made into the habits of the steelhead, or indeed of the salmon on this coast.

"I have some steelheads in our ponds here now 3 years old. We examined them about two weeks ago and found roe in the females and milt in the male, but so microscopic as to be almost rudimentary."

It is quite possible that these fish will spawn next year. We will see. It has been alleged that our rainbow trout is a fresh-water modification of the steelhead. Recent investigation, however, supplies evidence that the two fish are different, and this has been confirmed somewhat by our experience here. It is alleged that the Kamloops trout is an offshoot of the steelhead. The Kamloops trout is landlocked and never gets to the ocean, and so if it is a steelhead it goes to show that the steelhead will spawn without going to the sea. But, again, it must be said that as little is known of the Kamloops trout as of the steelhead proper. My own opinion is that if the steelhead will adapt himself to a fresh-water habitat it will spawn and rear young in it without going back to salt water.

It should be borne in mind that the natural range of the steelhead in the ocean on this coast is in water that never has any ice in it, and they do not enter the streams in the spring in any considerable numbers until the temperature of the water begins to rise; therefore I have some doubts that this fish can be successfully propagated in water that has ice over it during the winter season. Experiments only can determine this.

Within a year or two I stated in this journal that Jordan had declared that the rainbow trout was the young of the steelhead, or perhaps a better way of putting it would be to say, as Capt. Dougherty does, that it was a fresh-water modification of the steelhead. This theory has been found to be untenable, and Bean has untangled the subject in an article on the rainbow written for the report of the Fisheries, Game and Forest Commission of New York. The report is not yet issued, but soon will be, and I desire to give Dr. Bean credit at this time for his article separating the two species—the rainbow and the steelhead.

In a recent letter from Dr. Jordan, which has disappeared from my desk at the moment I wish to refer to it, he tells me that he never made the unqualified statement that the rainbow was the young of the steelhead, and that now he is of the opinion that it is not. I regret that I cannot give his own words, and will try and quote him in a later issue of *FOREST AND STREAM* if the letter turns up. As to the spawning of the steelhead, referred to by Capt. Dougherty, it is perhaps nothing strange that the steelhead should fail to spawn in their third year in confinement. Landlocked salmon have not spawned until their fourth year when planted in waters in which they have wide range, and the sea salmon (*salar*) confined in fresh water gave no evidence of spawning in their third year, and it is more than possible, from what Capt. Dougherty has observed, that the steelheads at his station will spawn next year, or when they are four years old. The steelheads planted in this State were planted in Lake George, Lake Champlain and Long Island streams, except about 5,000 of the fry, which I sent to a small but deep and cold lake in the Adirondacks, where, if they thrive, they will be under restraint and can be observed.

Accident to Veteran John Mowat.

Under date of June 15 Mr. Archibald Mitchell, of Norwich, Conn., writes me from the Restigouche River, New Brunswick: "You will no doubt feel pained to learn of a very serious accident which our esteemed friend Mr. John Mowat met with to-day. I had finished my morning's fishing on the Restigouche River, and while resting on shore after eating lunch Mr. Mowat happened to come down river in his canoe, having been up at Deeside for about two weeks fishing his own pools and had met with good success.

"He came ashore and we sat down together on a very large log which was lying on a steep bank about 25ft. from the water's edge and parallel with the river. We had just begun to enter into an interesting conversation in connection with our fishing experiences, when from our weight, I suppose, and without the slightest warning, the immense log commenced to roll down the bank toward the river and both of us in front of it. Mr. Mowat tried to escape by running down the bank, but unfortunately the log struck him and rolled completely over him. I made a hairbreadth escape by springing to the right and around the end of it. The log went clear down into the river, where my canoe happened to be, and smashed it beyond repair.

"I immediately rushed to my friend's assistance and asked him if he was badly hurt. He said, 'Yes; I am done for; I am done for.'

"In a few moments he became very pale, fainted and lost all consciousness. We placed a cushion under his head and made him as comfortable as possible. I thought then he was dying. My two men and I then placed him in his canoe and took him down river for about two and a half miles to the home of James Adams. Wired to his family at Campbellton and had Dr. Murray come on a special engine, and he arrived in a remarkably short space of time. Mr. Mowat regained consciousness before we took him out of the canoe, but he was suffering a great deal of pain. After an examination Dr. Murray found there were no bones broken and his spine seemed to be uninjured. His head escaped without injury, which was something miraculous. Dr. Hynam also came up in the evening. As far as the indications appear now the chances of his recovery seem to be good. If he is able to be removed he will be taken to his own home to-morrow in a canoe, which will be the best mode of conveyance for one in his condition. Mrs. Mowat and several members of his family are now with him. When

I was driven up river to-night I stopped and examined the log. If you saw it you would be puzzled to understand how such a large piece of timber could roll over any man without killing him. About the first words that he uttered after his mind became clear were: 'Oh, I am so glad it did not happen to you.' Had that log rolled over me I would have been a dead man now."

"Tuesday Morning, 16th.—I drove down to James Adams's house this morning and was glad to find that Mr. Mowat had spent a fairly comfortable night, and he is looking much better this morning. When I left they were getting ready to take him to his home in Campbellton."

After luncheon to-day I read Mr. Mowat's letter in the last issue of *FOREST AND STREAM*, and it reminded me that I ought to write to him. After dinner this evening I addressed an envelope to him, and before the ink was fairly dry Mr. Mitchell's letter came telling of the accident.

Mr. Mowat is 76 years old, but he comes of sturdy Scotch stock, and his out-of-door life on the Canadian salmon rivers in summer and in the forests in winter has kept him more vigorous than many a younger man. For more than fifty years he has been identified with the fisheries of Canada, and no man has stored up more knowledge of salmon fishing and the habits of the fish than he. That Mr. Mitchell should have been with Mr. Mowat at the time of the accident probably came about through the writer. Mr. Mowat had some salmon fishing to sell and told me about it. I wrote to Mr. Mitchell and he wired me to take it for him, and he entered into possession three years ago.

Mr. Mowat wrote me in August, 1895; he says: "I have been fairly well for a man of 75. I had about a month's outing in all, tenting out, cooking my own grub, paddling my own canoe, hooking and killing my own salmon (only eighteen) all alone, and I lost but one fish in the landing. Of course I am properly prepared for it, and would rather kill one fish all alone and fight him out than to kill ten with two men to paddle me around."

His first words after returning to consciousness, believing he was fatally hurt, were characteristic of the brave old man: he was glad that the injury had not happened to his friend.

Mr. Mowat's many friends will welcome news of his complete recovery, and may he be spared for years to come to kill fish in his own independent manner on the river he loves.

Marston Trout.

Mr. J. G. A. Creighton, of Ottawa, has sent me nine specimens of the Marston trout from Lac de Marbre. Unfortunately they were too long on the road to be in perfect condition for the table, but they were finely colored with the colors peculiar to this fish, though lacking the high colors of former specimens received, as they were nearing the breeding season. Mr. Creighton says they struck him as harder fighters than is usual for lake fish.

Salmon in the Hudson.

During the past dozen years I have used the head salmon in the Hudson a number of times over, but never with more satisfaction than I do now. Last week, while I was at the shad hatching station of the Fisheries, Game and Forest Commission on the Hudson near Catskill, I learned that a 15lb. salmon had been taken in Capt. John Pinder's net just before I arrived. The fish was released as soon as it was discovered, but it served to turn the talk of the fishermen to salmon instead of shad and herring. I was informed that salmon had been found in large numbers by one of Capt. Pinder's men on what he believed to be their spawning bed. A few days ago I made another visit to the shad works and learned where this supposed spawning ground of the salmon is located. The fisherman's statement is that he discovered the fish while hunting ducks. He was familiar with salmon, having seen a number taken in the nets he was fishing, and when he saw a number of large fish on a gravel bed he quickly recognized them as salmon. The time was last October, and he says if a net could be hauled around the bed the fish were so large and there were so many of them that no net that he had ever seen would hold the fish. The matter will be thoroughly investigated, and if it proves to be true that salmon are spawning in large numbers, as the fisherman declares, the State will doubtless be able to take its own salmon spawn from the Hudson River fish. The possibilities are great if the story is all that it promises for the future, and I can see no reason to doubt the man's statement that he did see salmon spawning.

A. N. CHENEY.

SMELT AND SALMON IN SUNAPEE LAKE.

ST. JOHNSBURY, Vt., June 13.—*Editor Forest and Stream:* I inclose herewith extracts from a letter recently received by me which might be of interest to some of your readers, and bring out a discussion either about Sunapee Lake or, what is more important, the question of fish food for such waters. It certainly would be unreasonable to think of depriving a body of water of desirable fish food for the purpose of forcing a fish to rise to the surface to take flies or artificial food.

JNO. W. TITCOMB.

"May 8th last I reached Sunapee Lake and thought I would try the fish for a few days before writing to you, as I intended doing. The few days lengthened to a week, but on the seventh day the bite came, the tackle fixed for a salmon gave notice, and I landed a 4lb. eel. Then another bite, and I landed a yellow perch of about 1lb.; then another and in came a bass of 3lb., which of course was returned to the water. Then another bite and a 4lb. sucker came to grief; then another and yet another, the last two being trout of 2½ and 2½lbs.. And this occurred in twenty minutes, after having fished the entire week without one bite. My companion caught one eel and bass the fourth day and nothing more until the eighth. I fished fourteen days from 7 A. M. to 7 P. M. and caught only a few trout the last six days. None big enough to talk about and no salmon. There was only one salmon, 8½lbs., caught while I was there and only a few trout. The poor fishing was laid to the smelt, as they had come in shore and run up the stream and then gone back to deeper water, and are followed wherever they go by the salmon and trout. Now it is a question in my mind whether smelt are or are not an advantage, and from what I learn at Sunapee, and I have been there now a number of times, I am about convinced that they are a disadvantage in more ways than one.

"They no doubt spoil fly-fishing, as the trout and salmon are forever after the smelt, and after the first week or so after the ice leaves it is almost impossible to catch the smelt for bait, and even if they are caught they cannot be kept alive more than a few minutes, and consequently it is about impossible to obtain bait, and even if it could be got it is of very little use when dead. Of course minnows, shiners and small suckers can be caught and kept alive; but where there are smelt in the water a piece of maple sugar for bait would be almost as effective as any other fish but smelt. No doubt of the smelt being great food; but if it spoils fishing with rod and tackle where is its advantage? It certainly may ruin the fly-fishing, as it no doubt does the bait fishing, to a very great extent.

"There is no fly-fishing at Sunapee at all, and the only way it is accounted for there is the smelt."

ON NEW ENGLAND WATERS.

BOSTON, June 22.—Lovers of the rod and reel will be pained to learn of the death of Hon. Daniel Gunn on Tuesday last, aged 72 years. Always an angler, he seemed to take greater delight in the sport as the years swept by. It was always a remark of his that he hoped to be able to go a-fishing at least once a year while life lasted. His wish came very near to being gratified, since it has been only the present season that ill health has prevented his making his annual trip to Nova Scotia for sea trout.

Reports of great bass fishing come from Lake Cobscookseecontee, in Maine. Mr. Gould, of Boston, is back from a very satisfactory trip there. Ninety-two bass are set down on his score. Druggist Talcott and Mr. Heintzman made a very pleasant bass fishing trip to Belgrade. Senator W. P. Frye, of Maine, has returned to his home, in Lewiston, from his spring trout fishing trip to his camp on Lake Cupsuptic. Mr. A. H. Proctor and Mr. Breed are back from a successful trout fishing trip to The Birches. They had the good fortune to see the big trout that were led in by Mr. Frost at Pleasant Island camps, even if they did not get quite as large ones themselves. Mr. Rodney P. Woodman will start on his annual trout fishing trip to Parlin Pond and Jackman early next week.

SPECIAL.

Judge Robert Grant, of Boston, whom I mentioned in *FOREST AND STREAM* a short time ago as having gone on a salmon fishing trip with Justice Horace Gray, of the U. S. Supreme Court, is back in Boston, a much disappointed man, having been called home suddenly on urgent business before he had a chance to wet a line.

Dr. F. S. Watson and party, of Boston, left this week for the Southwest Branch of the Miramichi River in New Brunswick. Salmon and sea trout fishing is the sport in view, and they expect to make a long stay.

F. W. Estabrook and George O. Whiting left on Friday night for a two weeks' trip to Parmachenee Lake. Mr. Estabrook is, I believe, a member of the Parmachenee Club, and has undertaken to initiate his friend Whiting (who is making his first trip) into all the mysteries of fly-casting. He will have an apt pupil.

Big Borris Lake, the headwaters of the Tuskett River, in Nova Scotia, is the destination of a party of Boston men who left the city a few days ago after salmon and trout.

C. W. Whitney and O. C. Whitcomb passed through Boston a few days ago en route to Bemis, in the Rangeley Lakes. Mr. Whitney is an old campaigner in the Rangeley country, and knows about every inch of it. They will be away two weeks, and will visit Kennebecago for some fly-fishing before returning.

C. F. Ropes and J. E. Spencer left on Saturday last for Billie Soule's camp at Indian Rock, Maine. Before returning they will make a trip up Kennebecago Stream and into the hills of that region, where there is a small pond from which Mr. Spencer took a 6lb. salmon a year ago.

Some other anglers who have gone to Billie Soule's within a few days are: J. M. Blakey, W. A. Tracy and Dr. H. F. Hamilton. Dr. Hamilton is a great lover of bass fishing, and intends stopping at Belgrade on his way home for a few days.

There are a few lucky bass fishermen over in Cambridge now, who have obtained permits to fish in Fresh Pond, from which the city's water supply is taken. The rules are quite strict regarding the fishing; only one boat being allowed each day between 6 and 10 A. M., and but two occupants to the boat. The greatest number of permits to any one person are six, and the season extends from May to December. About the same rules apply in Boston regarding the Chestnut Hill reservoir, and there has been something of a scramble among the Boston anglers for the much coveted permits. Bass are quite plentiful in both places, and last year some good catches were made. I hear that Jamaica Pond, which is now included in the Metropolitan Park system, is open to fishing, and an enthusiastic resident of that locality has told me that they are getting them by the barrel.

Smith's Pond, up at Wolfboro, N. H., used to be one of the most noted places in New England for bass. Since the craze has been on for the Belgrade ponds it has been neglected by its old friends, and the bass have had a chance to recover from the heavy onslaught made on them in the past. I am told that the fishing there is excellent now, and some of its old habitués are preparing to try it again. Chas. S. Bates, who used to go up year after year, left a few days ago for a ten days' stay, and C. J. Halpin has gone to stay about the same length of time.

Cod-fishing is much enjoyed by Mr. O. H. P. Stoddard, of the firm of Dame, Stoddard & Kendall. With H. A. Whittemore and F. S. Wadsworth, also connected with that house, he devoted a day last week to the sport off Duxbury, and the party captured about 75lbs. of fish. The usual severe attack of seasickness visited the boat, but was confined to one member of the party and was not unexpected. He fished through it all, and even has the courage to say he will try it again very soon.

N. L. Millard, C. H. Cutting, Stephen Fairfield and Zenas Sears, Jr., have left on an extended trip to the Seven Ponds and through the Dead River region of Maine. They will probably go as far as King and Bartlett, and intend giving all the ponds a good trial.

The Diamond Pond country, near Colebrook, N. H., is a famous old sporting region. The Dead Diamond camps during the lifetime of Amasa Ward were known far and wide, and even now are dear to the heart of many a sportsman. The ponds are well taken care of, being stocked annually by the State, and therefore the fishing always reliable. F. F. Proctor and W. H. Harris will spend the next ten days fishing and tramping up there,

making their headquarters at the camps of Martin Noyes. Mr. Proctor has made many trips to this region, and has promised that his friend Mr. Harris will be as well acquainted as he is with its many good points by the time they are ready to return. HACKLE.

CHICAGO AND THE WEST.

Glaciers and Bass.

CHICAGO, Ill., June 11.—On the morning of the second day of our stay at Westville, Ind., Dr. Hollenbeck, the well-posted and observant angler earlier referred to, kindly volunteered to act as guide to some of the more interesting spots of the region about. I got into his buggy with him and we started for the mill pond, wherein, according to his statement, the Calumet River had its ultimate source and beginning. We traveled due north from Westville over an excellent road for six miles, going gradually up all the while toward the top of the divide which separates Lake Michigan from the Kankakee waters.

"This wide and apparently level table land along which we are passing," said Dr. Hollenbeck, "is the richest land of this region, and is worth \$100 an acre. You can see the original forest trees standing over much of it, and now and then, as you will observe, there will be a patch of excellent sugar bush among these. This long and apparently level valley off to our right is a prairie glade which sinks off softly back of us toward the Kankakee, and is drained by Hog Creek, which we are leaving back of us. On ahead you can see this high valley narrowing, in between the timber-covered hills, until it finally pinches out right at the summit of the divide. Back of us is the long slope of the Kankakee side of the divide, up which the railroads have no difficulty in climbing. Ahead of us is the Calumet or Chicago side of the divide, and though you might not expect it on this apparently innocent looking prairie country, it has always been a trouble to get a grade on this side of the divide. It is very sharp, and even to-day the Lake Shore road has to use 'pushers' to get up this grade going East. Back of us, as you know, the Kankakee waters are slow and warm and sluggish, but on the north side of this divide, which we are now approaching, the streams are short and swift and cold, all rising in springs up toward the top of the divide. Strange as it may seem to you, the water in these Indiana creeks is ice cold, and, as I have said to you, quite capable of supporting trout. In one or two of these streams trout of great size have been raised for some time, and I know of other streams not fifty miles from here where some of us are putting in trout and with good results. The location of these it would not be wise for us to disclose. We fence out the native fish, such as bass and pike, by stone walls built across the stream, and eventually we hope to see the trout well established. We have observed nothing yet in the least discouraging, and it is the second season of the experiment.

"We will reach a spot whence you can see several of these little cold creeks making down to the Calumet River. That stream, as you know, rises south of the tip end of Lake Michigan and flows west and northwest around the end of the lake, just outside of the wild ridge of sandhills which lies at the foot of the lake. This wild sandhill country is the home of the Calumet Heights Club, of Chicago, and is to-day and will long remain a wilderness at the edge of the great city. No streams drain into the Calumet from the sandhill side, of course, but from this high divide side there are many which flow into it, and all are bass waters. We are now on top of the long divide from which these streams make down, and in the heart of one of the most singular bits of country you ever saw. Geologists tell us that the great glacier which came down from the North over this country, and scooped out Lake Michigan incidentally, stopped at about this point. This sharp divide which we are upon is really the terminal moraine of that glacier. Between this and the lake the sand dunes have formed. Off on the east end of our moraine we shall see some streams which break through the sand dunes and get into Lake Michigan by a course nearly north. Vail's Pond and Organ's Pond are ponds made on streams of this sort, and as you will see they are further to the east than the Calumet and tributaries, which have to go clear around the foot of the lake and come in at another corner entirely.

"Now suppose we go over to the west end of our moraine, and take up in order the streams which flow down into the Calumet River. You have been telling me about your discovery of the mill dam on Salt Creek which you thought was near the head of the Calumet River. You heard there that the head was away off toward Chesterton, and some said to you that it ran almost to Valparaiso. Your information was not correct, for though there are creeks running up into that country, they are not the ultimate source of the Calumet, which lies much further east—which indeed lies here, right at our feet below this hill, in what is known as Rotzene's Pond, on a creek not dignified with a name except that of Rotzene's Creek.

Creeks and Ponds.

"Your creek you called Salt Creek, and so far from being the tributary furthest east it is the one furthest west of the short streams from the divide. On this side, or east of Salt Creek, are Coffee Creek and a series of others, most of which are best reached via Chesterton, and on which are to be found, in this order as you go from west to east: Baum's Pond, Long's Pond, Brown's Pond, Snider's Pond and Rotzene's Pond, the last being the creek furthest east, as you can see from what I have said. You were probably at Gossett's Pond on Salt Creek. All these 'ponds' are mill ponds, and the dams which make them still stand for the most part as the early settlers built them on these streams. It was because the creeks are strong and regular, spring-fed in short, and with good location to get a head of water for milling purposes.

"There were bass in the lower portions of all these creeks, for they ran up from the Calumet, but the bass would not be in these mill ponds to-day if they had not been put in there by artificial means. You say that the bass were once very large in Gossett's Pond on Salt Creek. They are equally large in some of the other ponds we have in review. Off on our left you can see the course of the little spring creek where we go to catch our minnows. A mile below this creek is dammed, and this makes Snider's Pond. There are no pike or bass in there, only sunfish and that sort of fish. The bass in Rotzene's

Pond are all from planted stock. We also continually plant fish in the little lake your friend Phillips told you about near the village of Westville. In fact this whole fishing country here is artificial in one sense."

Glacial Lakes.

"If you will follow our terminal moraine around the foot of Lake Michigan, from Salt Creek east, to a point beyond Vail's Pond and Organ's Pond, you will hear not only of all these ponds I have enumerated, but a great many little lakes besides and several large lakes. All these are glacial lakes, merely ground into the soil by the heel of the glacier. You all think the little lake Mr. Phillips told you of is a 'spring-fed' lake, but it is not. There are no springs in it or about it. It is purely landlocked, and has no inlet or outlet, just as a dozen others in this immediate neighborhood. I think the level of all these lakes is falling rapidly, notably in the one above mentioned, which we call Clear Lake. Over east of us a little way, and just beyond Rotzene's Pond, there is another Clear Lake, in the settlement known as Sweden. It is also a clear, deep, cold water, very deep—a conical pot-hole ground down deep into the earth and filled with water which seems never to have gotten warm yet since the days of the great ice. Still further to the northeast is Hudson Lake, on the Lake Shore R. R., a very good fishing water indeed.

"There are several systems then, as you see, under which we may group the fishing waters of this section on top of our moraine. Let us begin off the left, or on the Chicago side of these. You have already learned of the creeks and ponds accessible from Chesterton by short rides, and we will say that Brown's Pond is the last to the east of these. The B. & O. will take you to Chesterton. To Valparaiso you can get easily by the Panhandle, Nickel Plate or Grand Trunk railways, and near by that point you will find several of these glacial lakes, these being in their order from west to east: Flint Lake, Long Lake, Wauhub Lake and Skunk Lake. Understand, these are glacial or landlocked lakes now, and they lie further back or up more to the top of the divide than the mill ponds we have been studying. All these lakes are good bass waters, though, as you know, they have not been treated right in the way they have been fished. We certainly need a better state of affairs and hope to have it some day, for the better class of the population begin to realize that the old destructive ways of fishing will not do for to-day."

Railroads and Bass Systems.

"To Westville, or near to it, as you know, you can get by the Wabash, the Grand Trunk or the B. & O., and that brings you to the point where we are standing now, though you could reach it by others of the network of roads which cross here. There are many fishing waters within say a dozen miles of that little town.

"You can by the Lake Shore road get to La Porte, and thus be at the door of yet another lake system of the glacial sort, none of these draining into the Calumet or Kankakee rivers. The names of these lakes at La Porte, from west to east, are in order: West Twin, East Twin, Pine, Stone, Clear and Fish-Trap lakes. They are all good bass waters, though shamefully netted. One set of seiners this spring took in Fish-Trap Lake 3,700 lbs. of bass. On the Little Kankakee, a stream which drains into the Kankakee, there were this spring, as I learn from the statement of a resident, three nets stretched across the stream, which took tons of bass, and in fact let absolutely none escape which came up, as they entirely crossed the river from side to side. There is bass fishing at La Porte. It would be a grand place for Chicago anglers if the residents would only stop such hogginess and give the anglers and their money a chance to come into the country.

"Still another system of these bass waters of our neighborhood heads in at Fish Lake. This is the only one of the waters mentioned which drains into the Kankakee. Being thus stocked annually, as much as the natives will allow at least, by fish from that stream, it is a fine bass and pike water. This lake is reached by the Grand Trunk road to a point called Swift's, where the big ice-houses are. It is probably about as safe as any place mentioned for a good catch of bass on such a trip as a Chicago angler would be likely to take without any regular guide or a very good acquaintance with the country.

"The Kankakee, as you know, is a fine bass stream, and so also is the Wabash. Still another system of bass waters which should appeal to your Chicago bass fishers lies not far from this same singular glacial country. The Wabash road will take you to Wolcottville, some little distance from this point, up toward the northeast corner of the State. Here you get the headwaters of the Wabash river and are in the heart of a grand series of bass lakes. It would give you a fine trip, some of you Chicago fishermen, to go over in there and look that country up. If you will come some time later we will go over there and have a good go at the bass, for that is as good territory as I know.

"South of us some miles, as you have learned in your earlier Indiana trips, are such larger and river-drained waters as Maxinkuckee and Cedar lakes, and such bass waters as the Tippecanoe, the Yellow River, etc., etc.

"Thus, you see, you are here in the heart of one of the finest bass regions in the entire West, only from fifty to ninety miles from Chicago by rail; just a pleasant evening run for a trip of a day or two, such as that usually desired by the Chicago fishers, who have not time to run away off for a fishing trip, but yet want to get some bass when they do go. And see what a variety of railroads one has to choose from. The Grand Trunk, Wabash, B. & O., Erie, Panhandle, Nickel Plate, Lake Shore, and indeed all the East-bound roads, cross this country in a narrow strip along the top of our terminal moraine. For one who enjoys a bit of exploring and does not care for a lot of fish alone, there is no more inviting locality lying about the big city, and after one has learned it well he will find he can make as fine catches of bass there as anywhere in the country, and take as big bass as any he has ever seen."

New Chicago Bass Country.

As I have said earlier in this description, it had been for some time my belief that I had seen and fished in all the good bass waters within 100 miles of Chicago. I was surprised and delighted to see how much in error I had been all this time. Perhaps many of our friends who regularly go elsewhere may care this season to take a try at these waters, which are very accessible, and which, so far as

can learn, are not generally well known to the craft in this city. I can give my personal testimony to the assertion that they are likely spots. In general appearance the country is much like that of Waukesha county of Wisconsin, there being the same short, sharp hills, interspersed with the same peculiar deep, conical potholes boring down into the earth. The region is naturally hardwood truck country, the whole crossed with pleasant little streams of cold water.

An Honorable Mill.

We had paused for some time at the top of the divide while Dr. Hollenbeck pointed out to me the topography of the country and gave me the substance of the facts which I have set out above. We then dropped down from the summit into the valley of the Calumet. At our feet lay a little stream, broad and swift and shallow, as becomes a spring-fed brook. It lay under and between deep foliated trees, and prattled merrily, as all such little rivers do. On our right, within a few yards of the roadway, stood a mill, an ancient, hoary, honorable mill, of just such sort as we read about in novels or see pictured in the thousand forms of art, all harking back to one original, which I make no doubt was this same one here on the mysterious Calumet, a mill builded by whose hand history doth not recount. Across from point to point of the narrow and tree-shielded valley stretched a narrow and high dam, through which the water dripped and trickled coolly, falling down into a black and shady spot hid by the trees and vines. Here was such a wheel as our fathers might have made, led up to by such a mill race as our grandfathers may have cut. And on the hill above the mill stood the house of the miller, who I hope is honest. It goes without saying that this miller had a boat, a broad boat, of the sort you always find on mill-ponds, a very poor sort of boat for going anywhere, but a good boat in its way, redolent of memories of bullheads and of angle-worms, and built upon the theory of the place, to wit, that time is long and mill ponds permanent, so that all boats thereon come back eventually to the mill, and so need not be built for speed or ease of going.

A Gruesome Trail.

And what a mill pond! Broad, deep, full of snags and stumps, grown up with water plants, but threaded with deep pockets and open bits of channel, it was a happy home for bass, and the sight of it was enough to set one speculating. Here too we might fish and break no law; so we put a minnow to work—with no success, because that is frog water, if ever such lay out of doors, though the local anglers believe most in minnow and spoon.

But still we were not at the head of the Calumet. "Wait," said my companion, "and we shall see the very utmost spring of this hidden river." So on we pushed. The oars were turned into pushing paddles, and for half a mile we toiled, as only anglers would toil, through masses of water moss and great beds of lilies and reaches of weed-grown water, over which the broad boat had fairly to be dragged. It was a gruesome trail, this, through the upper reaches of the pond. The channel vanished in a great marsh. Our companions, Messrs. Henton, Phillips and Charlie Ansley, kept pace with us for a time, but gradually passed out of our sight and hearing across an impenetrable morass, in the middle of which was the trickle of water along which we were creeping. Sometimes we got a glimpse of the channel below us, but it was so overgrown that we got no flotation from it and had to push over the top of it on the weeds and rushes.

"Not a dozen men in the entire year ever get into this pond," said Dr. Hollenbeck, and I could well believe him. We were an hour going half a mile. It reminded me of a certain creek in Wisconsin, of which J. B. H. and I wot very well, since we spent a day learning the thread of the water through the marsh, just as my companion and I were here doing.

The Mysterious Source.

But at last our work neared its end. "I can see the last of the marsh," said Dr. Hollenbeck, and surely enough there was a straight lead of green, showing where the water was, or where it could be seen in the early spring perhaps, though none could be seen now, and nothing indicating it except the heavy and dark cover of the "spatterdocks" which grew high above the water. Through these we pushed, a foot at a time, until at last we saw open water ahead. A moment later we came out into a little round, black, ugly, forbidding lakelet, pond or spring hole, whatever one choose to call it, set down deep at the bottom of a circular valley whose sides were fringed with trees. It was perfectly circular, apparently of about twenty-five or thirty acres extent, and entirely without inlet. Except for the hidden stream up which we had come for a course of a mile or so it had no outlet. It lay like a black and forbidding gem of some devil's circlet, motionless, unresponsive and austere. My first word was, "What a bass hole!" My next was, "Let us get out of here." I own that I felt a shiver creep up my spine. Never in my life have I been in a more forbidding spot. It is no wonder that it is not known by many and that it is visited by few. He who sees it once has small concern to see it again. It is a devil's water, mid-secret in a secret land, and no place for gentlemen in search of sport.

"This is the head of the Calumet," said my friend. "There is nothing above this. I don't know what you can call this hole. It must have springs in it or around it, or else be the coming-up place of the water that seems to lie under all this country. It is deep, I don't know how deep, but probably 60 or 80 ft., maybe more. It is not fished by any one to mention. I know of only one party being in here this spring, and they caught a fine lot of bass, some over 5 lbs. each. There is no way on earth of getting to it except by the way we have come, and I believe that in two or three weeks from now it would be impossible to get a boat up here at all over the weeds. They fairly fill up the stream in the summer time.

Solitary and Inaccessible.

"All around this pool, as you see, the marsh makes a rim of 50 to 75 or 100 yds. in width. It might as well be a mile, so far as crossing it is concerned. Not the most expert Kankakee pusher on top of earth could get out to us from the shore over that bog. I tried it once and want no more of it. The ground began to sink down into a cone beneath my feet and to tremble for 20 yds. about me. Trees as thick as my leg, standing upon apparently solid ground, began to waver and bend from side to side. Ahead of me was still more treacherous bog, and I was

glad enough to get out of there alive. If one should get through the crust of the bog no soul on earth would ever see him again, and only speculation could exist as to where he went beneath the bog. It is bottomless so far as I know. Now come on in and let me show you about how much chance you will have to get out of here if anything should happen to our boat."

A Black and Deadly Water.

Accordingly we began to row slowly about the edge of the pool, searching for some spot where solid ground could be reached by swimming, wading or crawling. We were forced to believe that not the most desperate man, no matter what his straights or what his skill in the travel of the marsh, could ever make his way within 40yds. of the shore. All around the pool was a rim of high lily pads and dock leaves which stood dank and coarse to a height of 2 or 3ft. above the water. Their roots ran down a dozen or perhaps 20ft. into soft mud, intertwined with all sorts of rank water plants. These pads and spatterdocks stood on the edge of a sharp bar, which encircled the lake completely, and from which the water dropped abruptly down, 20 to 30ft. in depth at once. It was as black and cold and deadly looking a water as I ever saw and touched, and gave one a feeling of dread to look at.

Outside of the rim of lily pads the water plants grew in water a trifle more shoal as the edge of the bog was approached, though at no place attainable by the boat was the water less than 5ft. deep. Beyond that came the rushes and the flags and the green floating turf and the soft bog in order, and then the hard and high shore which surrounded it all. Upon this shore, under a clump of trees, our other companions were waiting for us. It had been thought that there was a second boat somewhere upon this pool, which we were to take out for the others. But we found no boat, and it would have made no difference if we had, for we could not have gotten the lightest canoe across that treacherous bog to them. We got no closer than about 80yds. of them, although we wanted to get in to take one or two of them aboard our boat, and at length we had to give it up and remain a hopelessly divided party, the intervening waters bridged only by the thoughts that come from each to the other, and by our shouted words of regret and explanation.

Thus it may be seen what it means to actually attain the head of the Calumet. There are not very many who can say that in any recent time they have attained it. No human being can reach it except by boat, and the boat must come up the slow and sluggish creek. If all knew what was at the head of the creek they might seek the harder to get through the water weeds, but a half mile or so of dragging is more than most men care to do, unless for a definite purpose, such as that which actuated my friend and myself. But thanks to his knowledge of the country and to perseverance with the push paddles, we reached our objective point, and now I think I can truthfully and accurately say that the head of the Calumet has been found! This fact will be noted with interest by the members of the Calumet Heights Club, to whom the question seems long to have remained one of interesting but unsettled speculation.

A Place of Spirits.

We did not remain a great while on this water. "I never feel comfortable in here," said Dr. Hollenbeck, "and though I know it is as good a bass hole as any in the country, I never like to come here. A fellow goes fishing for sport, for fun; but I declare that he can't have any fun in this hole here. It's too dismal, and it keeps one uneasy and uncomfortable all the time, so that he doesn't enjoy himself. One thing sure, if anything happens to his boat he'd just as well say his prayers, for no one ever comes up near here, and he could never get out without his boat. If it sprung a leak he couldn't go ashore, and if he upset anywhere near these accursed lily stems he could never swim nor wade nor wallow either to the boat or to the shore. But it isn't the sense of fear, of course. We aren't cowards, and we know we can take care of ourselves in the boat all right, and of course we've both been in far more dangerous places and didn't mind it at all. That isn't it. There's something uncanny, something repellant about this hole. It's a good place to catch bass, but it's no kind of a place to go fishing. Here it is, a warm summer day, but I give you my word I can feel my back crawling this minute! If this place isn't haunted there never was one on earth!"

"Let's go home," said I; for the longer I stayed there the unhappier I got. I don't want to fish in a place where a fellow has cold chills along his back in the middle of a hot afternoon, and I vow that that is just what I was experiencing, the same as my friend. So we pulled our boat for the dim mouth of the little outlet, and at last got back to the mill and took passage thence for home.

I am not sure but that some day Dr. Hollenbeck and I will go up into that haunted pool with a bag full of frogs and kill a few big bass, but this we shall do merely from a sense of duty, and not because we believe it will be any pleasure at all. When we go fishing for fun, we want to have a warmer spine than is possible on the head pool of the Calumet, that dank, dark, uncommunicative river whose source is hid within and withunder the bottomless bogs under the foot of the dead glacier of the North. On the bottomless pit it may perhaps take hold, for we sought not to sound it beyond a few score feet, and then down under the shaking bog that protects it there may be under-water people who resent intrusion, and so put cold hands along one's spine. These people, I do not doubt, used once to live on the edge of the great glacier as it came down from the North, and so have lived here ever since, this being as far as they ever traveled from their home in the North. It is no wonder that their hands are cold and their speech somewhat frigid and repellant.

The Texas Situation.

Mr. R. H. Foat, of Wetherford, Tex., was in Chicago this week on his way to Lake Vieux Desert for a muscally-long trip. Mr. Foat says that the tarpon season this spring at Aransas Pass has not been so very good. Only five tarpon had been taken at the time of his late visit there, two by a Mr. Sutherland, of Chicago, and three by a gentleman from Michigan who was fishing with the same party.

Mr. Foat says that in another year or so the Northern shooters will not have the opportunity to come into Texas and carry on a wholesale destruction of game. There is very intense feeling in parts of the State over the doings

of last season. The intention is to frame a law stopping market-shooting and limiting non-resident shooting. He says that one market-hunter at Rockport, Tex., claims that he made \$1,200 on ducks last winter. Mr. Foat thinks that the supply of wildfowl will not long stand the combined inroads recently made upon them.

Not Much Fishing.

The weather here has remained so cold and uninviting that not so much fishing as usual has been going on. I have not heard of any large muscally-long having been taken this season, though it is not time yet to get in reports from the muscally-long waters. Messrs. Mussey, Dicks and the others of the party who went up to Big Sand Lake are maintaining a silence which I hope means intent enjoyment. At last the members of the Wishninnine Club were on their way up the river to Manitowish. Trolling in the river on the way up to the dam, Mr. Dennis took a 10lbs. muscally-long and Mr. Clark one weighing 13½lbs. This would augur well for their success when on their intended fishing ground.

Arkansas Bass.

Mr. Joseph Irwin, of Little Rock, Ark., states that fine catches of bass have been made at Clear Lake, twenty miles south of Little Rock. Five bass weighing over 5½lbs. each were taken by one party of which two were over 6lbs. each. The son of Mr. William Turrel took several heavy bass in his mill pond, one weighing 7lbs. A negro fisherman took in the same pond a bass weighing over 8lbs., which is thought to be the heaviest taken in that section for some time.

Mr. Irwin says that the turkey shooting was very fine on the St. Francis River this spring, and that he shared the sport with great pleasure.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

FLY-FISHING

On the North Shore of Lake Superior.

[Continued from page 497.]

WE arose in the morning with dismay pictured on every countenance, for a heavy fog was streaming in from the lake like a drizzling rain. The trees were dark and dripping, the bushes and grasses bending to the earth with heavy moisture, and the leaves, lately so gay of tint, fell in dead heaps or drifted mournfully on the sweeping wings of an easterly wind. Everything was in melancholy somberness, and the sky was completely shut out by the great vapors that rolled o'er the shadowless waters and into the green woods and around the mountain peaks and pinnacled cliffs. Ned was out of humor, the half-breeds in the same condition and I was fast going in the same direction.

"It may clear up," says Ned, grasping at a rap of hope.

"Well, we'll have breakfast first and then we see," says philosophic Kenosh.

When that was partaken of Ned and I strolled along a sandy beach that had formed here and scanned that fog with the eye of an astronomer whose sole ambition is to discover an unknown planet. Our planet that we so longed for was the blue sky above, but we saw it not, nothing rewarding our penetrating gaze but the rolling and falling mist. There was just air enough to crisp the sea and send ripples o'er the sandy beach in the sweetest of falsetto notes.

Wearied of tramping on the hard sand, we took a seat on a fallen tree whose branches were in the water, and which rose and fell according to the strength of the incoming wave. Tiring of viewing the fog banks, which offered no solution of the weather, we returned to camp and found our "boys" packing up for a departure.

"Going off in the fog?" says Ned, when we had joined them.

"That's it. We make the island anyhow," says Kenosh.

"Yes, if you don't get lost in the fog, as you did the other day in the Bay."

"You give me course then."

"All right, I will pilot you, and it will be by compass too."

This part of the embarkation being satisfactorily settled, the boys resumed their work, and in a brief time everything was aboard. Just as we were about to shove off along comes the generalissimo with his little band, who were somewhat surprised at our going off so suddenly in the fog.

"Say, where are you going?" hastily questioned the ruling chief.

"Aguawa Harbor," replied Ned.

"You will get lost in the fog."

"Not so bad as you in the cracker box," quickly spoke up Kenosh.

"What about the cracker box, Kenosh?"

"The little devils eat heap, 4 or 5lbs."

"Say," says Ned, turning indignantly to the boys, "didn't you feed our crackers to the dogs?"

"Yes, but they were awful hungry too," he boldly replied, and then the boys all smiled.

"Why, we hired you to keep the dogs away."

"We didn't let 'em in the tent, we fed 'em on the outside. They were awful hungry, I tell you."

The little plunderers were so tickled over their leader's unblushing acknowledgment that they were ready to turn somersaults in very excess of joy.

"Why, you are as bad as pirates."

"I tell you we were awful hungry, dogs too, and didn't I offer to pay you for all we took," came back the retort.

Ned was angry, but this last response nevertheless made him smile, and when Kenosh assured him that we had an abundance of crackers left he turned to the boys as the boat was disappearing in the fog and good-naturedly said, "Boys, we'll have a word with you when we return."

"All right. Say, old man, hold 'er nor'nor'west and you will come out all right."

"The little devil right," says Kenosh, and so we headed "nor'nor'west" and soon were lost to sight of land, with all the poetry of the skies and the earth hidden by the misty vapors.

"I now understand," says Ned when we were plunging along, "why that little imp wanted to reimburse us for the abstracted crackers. It was simply the subterfuge of a wily diplomat, for he knew full well that we would not accept his coin, and he also knew that he had pilfered more crackers than he ought. Think of our paying him to keep away the hungry dogs and then of his calling them up and cramming them with our choice soda

crackers. What a grand feast it must have been for those immense canines who are continually in a famished condition. We, however, involuntarily did a good action, although it was accomplished by stealth."

"They smart half-breeds," says Kenosh.

"Yes, if looting is considered smart, they are, I replied.

"What looting?"

"Stealing."

"Oh, oh, I see. I know now. Looting be steal. I use him when back home." And then the half-breed seemed pleased with himself that he had obtained complete knowledge of the word.

For about three-quarters of an hour we held the boat on her course, and just as we reached Maimaise Point the fog, which had been growing lighter and lighter, lifted sufficiently to show the land. We found we were right, but just here we had to change to almost due north, and it was indeed fortunate for us that the fog lifted or else we would have been very materially off our course. Here the wind dropped and we were compelled to take oars for our motive powers. On reaching Point au Pins a south wind sprang up and once more the sails were hoisted and away we sped o'er a sea that was dancing in merry ripples. Soon the sun beamed down upon us, with not a vestige of the fog left. It had disappeared to regions beyond, much to our immediate relief. Flocks of crimson, like floating rose leaves, drifted in the sky above the mountain tops, and below these delicate flushes radiated and penetrated the moistened forest. Here the towering elevations are seamed with many a rift and gorge, the secret birthplace and nursery of the glittering brooks that come sparkling into life and go dancing down the mountain side to contribute their cool and purling waters to the great reservoir.

Along this range the Montreal has its headwaters, as also the Aguawa and other lesser streams. The gleaming trout formerly roved along this picturesque shore in countless numbers, but now, alas! they have almost entirely disappeared, and into the rapacious hands of the market purveyor.

Arriving at a small rocky islet that was then gleaming in rich colors, Kenosh informed us that a few years ago a party of anglers *en route* home from the North Shore stopped at this place to camp for the night despite the remonstrance of their tawny boatmen. They tried hard to convince the fishermen of danger if caught there in a storm, but they laughed at the half-breeds' timidity and emphatically ordered the tents to be pitched on the misshapen and barren island. Up went the fluttering canvas as per order, but about midnight when they were all sound asleep a sudden storm arose and came down upon them with sweeping violence. When the gale first struck the island away went their tents and away went considerable of their outfit. It was then neck or nothing with them and was really a miracle that they got safely ashore. After that the boatmen's edict was duly honored.

As we sailed o'er the lucent waves the fiery gold radiance of the sun spread itself out in wilder glory and the great massive rocks of incongruous shapes, which lined the shore and had the writing of ages upon their hoary faces, were in steely shimmer, while the forests adjacent were full of glowing colors. We are now abreast of Montreal River, with its two towering hills that guard its spreading mouth, and with a few miles more advance the waters of the Aguawa will wash our boat. Here we saw on the beach the tents of a party of anglers from Grand Rapids. They had left the "Soo" a week in advance of us and proposed to pass six weeks at this place, long enough we thought to deplete the racing river of its finny population. The party consisted of Henry Post and wife, Dr. Kirkland and wife, Charles Withey, James Campbell and B. C. Robinson, and in addition three dogs. They were a lively party and had an avalanche of fun and caught trout galore. I really pitied the ladies when I came to consider what a terrible place the Aguawa was for the buzzing and biting insects. Dr. Robinson, however, assured me that the ladies had pants, and I learned after their trip that they had proved just the thing to ward off the attacks of the tiny horde, the pest of all anglers on this shore. Stick a pin here, ladies, when you take the North Shore trip.

About 2 o'clock we reached Aguawa harbor, about three miles from the river of that name, and camped on one of the small islands so numerous here, and really the only camping place at this harbor, and one of the best on the North Shore. Here we found that a party of anglers, who had left the "Soo" at the same time the Grand Rapids party did, had preceded us at this place, and as we thought depleted the waters of the spangled beauties that rove along these grand and picturesque shores. We learned afterward that they remained only one day and caught no trout whatever. Such bad luck drove them back to their former camping place, Jackson's Cove, where they stated they caught 150 fine brook trout during their ten days' stay. The party embraced Herschel V. Whittaker, Horace W. Davis, F. B. Dickinson, Wm. E. Robinson, Hon. John W. Preston, F. E. Brooke and Harvey Marks, all of Detroit except Davis and Marks. The first three mentioned are the fish commissioners of Michigan, while the last is the assistant superintendent of the State Fish Hatchery at the "Soo." We found them all high-toned gentlemen, as well as genuine gilt-edged anglers. Mr. Whittaker is said to be an expert piscator and drops his flies with not only the lightness of a falling snowflake, but where he wills them. He might not cast a lure in the space a nickel fills, but he can do it nine times out of ten within the circumscribed limits of a silver dollar. That's a feat in fly-casting a notch above my piscatorial accomplishment, for I would require a good-sized hat to bound my limits in casting at a mark. Ned can speak for himself, but I think he is in my class.

After we had the camp in fine trim and partaken of a good square meal, we started with the boat to ascertain if the departed anglers had left a trout that we could entice. The harbor is a noted place, and that afternoon, with the bright sun glowing on its battered walls that rose up in an almost perpendicular line from the water, was doubly impressive. This part of the lake is not only picturesque, but extremely idyllic in its poetic beauty, and a region where Oreads might have sported while Diana pursued the fleeting game that has for ages made these mountain fastnesses its favorite haunts, for

"Here where her orchards, walled in every side,
To lawless sylvans all access denied."

We first skirted along the north side, which was exceedingly generous in ledges and crevices, and just the

place where a brook beauty would love to dwell and rove. Kenosh stated that he had been over the ground some ten years ago with the Hon. Andrew Jackson, of the "Soo," and they found the trout so abundant that the sport soon palled. Double catches, he said, were as plentiful as single, and frequently to prolong the sport only one fly was used. This sounds like romance, but I know it to be a fact, for I have had some evidence of it since I have been making my annual outings to these mountainous shores. Well, that is all past, and of the present we will now dwell.

Ned, who was in the bow of the boat, was reaching out for the trout with a red-ibis for the stretcher and a brown hackle for the dropper. I chose for my lures my old favorites, a Parmachenee-belle for the first fly and a Henshall for my second, and have always found them highly attractive. We were not at all hopeful, for the balsam beds, which we had found at our quarters, were too fresh and too numerous to give us much, if any, encouragement.

After coursing along for a quarter of a mile without a single rise we came to a massive block of stone a few feet from the great wall that rose above the water and around which the wavelets were sportively playing and where we both flogged the undulating surface, until at last Ned coaxed up a full pounder that sprang for his stretcher in such a vicious manner and that made such a tumult in the water that I thought it a ponderous trout. Ned having hooked him and feeling his weight knew better, but still small as the little beauty was it made music for him, and when it came to the boat from the net showed up as an ideal representative of that race who beautify themselves in gold and silver and purple. We thought it the one solitary fish the recent rodsters had left, and visions of a nice browned trout for supper would now surely be realized.

After flogging around this huge rock until we were somewhat wearied, we retraced the route, and not till we had reached a grand cluster of disorganized and craved granite did we tempt another trout. Here I aroused a scarlet dandy that sprang upon my Parmachenee-belle like a falcon upon a wildfowl. He started lovely notes of music from the reel and made the little chub bamboo beat and bend to the correct tune. A stirring poem of great beauty could have been written upon the desperate struggle between victor and victim, but it would require a Longfellow or a McLellan, who wrote the following lines, to give the grand battle notes melliflently and eloquently.

"Oh, thoughtful angler, loving well the toil

To tread the tangled brook or river—

To wield the tapering rod o'er ocean tides,

Or breezy gulf or inland lakes immense,

We thank thee for the lessons thou hast taught—

This added treasure to the angler's lore.

Fair smile the skies and soft may breezes blow

(The soft south breeze—to angler's heart so dear),

And green may blossoming groves their garlands show,

And woodland choristers fresh tune their harps,

When thou dost follow in the coming year

The gentle angler's meditative art."

With the capture of this trout, a two-pounder, we became very hopeful, and began to think after all that our predecessors of the gentle art had not gobbled up the last trout. We fished faithfully here for some time and not another one felt disposed to toy with our dropping or dancing lures. The afternoon was now fast departing, and with the blue sky above, the green shade of forest pines, the empurpled clouds catching the tints of the sun, and the lines of bluff, red and brown, marking the strata of cliff and crag, made a picture at this hour that was both a charm and a delight. On we go, along the shoreland that leads to the rippling Aguawa, dropping our flies over every chasm and fissure, and around every rock and boulder, and were finally rewarded with two more trout, which gave us enough of the toothsome fish for both supper and breakfast. This closed our trouting for the afternoon, and then word went to our boatmen to push along lively for camp.

As we were passing the bold and scarified bluffs from which arose towering mountains, I thought of a chapter in Ruskin's fourth volume of "Modern Painters," wherein he tells us that a line drawn over a great Alpine ridge so as to touch the principal peaks that jut from it will usually be found to be part of an unreturning or immortal curve. The grandeur of the Alpine pinnacles is bounded by that law of sympathy. Although there are no such towering ranges on this shore, still the elevations here are of sufficient magnitude to be subject to the same line of grace. The jutting rocks and the seemingly lawless notchings, like the scalloping of a lovely leaf, hinted the sweep of an infinite curve.

After I returned home I sought the volume I have mentioned, and cannot refrain from quoting in this letter the passage on the 189th page, that now lies open before me, and which I have read with new interest:

"Nature gives us in these mountains a more clear demonstration of her will. She is here driven to make fracture the law of being. She cannot tuff the rock edges with moss or round them by water, or hide them with leaves and roots. She is bound to produce a form admirable to human beings, by continually breaking away of substance. And behold, so soon as she is compelled to do this, she changes the law of fracture itself. 'Growth,' she seems to say, 'is not essential to my work, nor concealment, nor softness; but curvature is, and if I must produce my forms of breaking them, the fracture itself shall be in curves. If, instead of dew and sunshine, the only instruments I am to use are the lightning and the frost, then their forked tongues and crystal wedges shall still work out my laws of tender line. Devastation instead of nurture may be the task of all my elements, and age after age may only prolong the unrenovated ruins; but the appointments of typical beauty which have been made over all creatures shall not therefore be abandoned; and the rocks shall be ruled in their perpetual perishings by the same ordinances that direct the bending of the reed and the blush of the rose.'" How applicable is all this to this rugged and ragged shoreland of pinnacled mountains, beetling cliffs and bold headlands.

That evening after supper Kenosh built a huge fire in a rocky depression that had a wall of sufficient height on the lake side that admirably shielded us from the high wind as it coldly came from the ruffled waters. Ned was in a glorious humor, and being a raconteur of the first order entertained us with many a racy and humorous

story of some of his outings in the old country. Kenosh, becoming enthused with the narrations, and having had many exciting experiences in the same line, was emboldened sufficiently to tell us of the first bear he shot in the Goulais Bay forests. "One day," Kenosh stated, "I was out with my gun ready for any kind of game, and finding it quite scarce, I penetrated deeper and deeper into the dense woods, when all at once I espied a big black bear up a tree, observing very calmly my approach. I suddenly halted when I saw him, and my heart commenced beating a lively tattoo against my ribs. I gazed very intently at the bear, and he gazed about as intently at me. At first a cold chill ran up my back, and demoralization began to take immediate possession of me. I was for retreating at once, but when I thought of the ignominy of it my courage returned and then I determined to take a shot at him, let the result be what it would. I well knew if I only wounded him slightly that it would go hard with me, and there would in all probability be one less half-breed on earth."

"And another in heaven," put in Ned.

"I hope so."

"Well," continued Kenosh, "I walked carefully up to the bear till I got within good shooting distance and then the bear became restive and was doubtless thinking some mischief was meant him. Getting behind a tree, I took good aim, pulled the trigger, and as the bear swayed about a trifle I got badly scared, dropped the gun and ran with the speed of a deer. I was sure the bear was chasing me after I got well under way, and then I began to put forth all the vigor I could into my fleeing feet. As I proceeded I was positive I heard something pattering after me like the footfall of a pursuing bear. Faster and faster I went, and thump, thump, thump fell upon my ears at every step. I was so badly frightened that I was determined to spring on to the first tree I came to that I thought too small for a bear to climb. Finally coming across one in my rapid flight, I sprang to it with a superhuman activity and was up in the crotch in a twinkling. I then turned to look at the bear, which I expected to see at the trunk of the tree, but he was nowhere to be seen. I assure you I was agreeably surprised, and after looking around for a while and getting rested, I started to come down and found that something held me to the tree. On examination I ascertained it to be a dead branch with withered leaves that was securely fastened to my coat pocket behind by a short prong which had doubtless hooked itself there in my race. That was the bear that was chasing me and had nearly frightened the life out of me. I smiled to think of it, and was really glad that I could smile. Well, I unhooked the prong, cast the branch away, climbed down, and then very carefully retraced my flying footsteps. Coming at last to where I had shot at the bear, I saw my gun where I had left it, and then securing it, loaded anew and began the forward march for the bear, but it was with slow and very stealthy steps, I assure you. Reaching the tree where I had shot him, he was not to be seen, but there was a pool of blood and drippings that led from it. I followed the gory drops for quite a distance, and just as I was about to abandon all hope of finding the bear I saw just ahead of me what appeared like bruin's paw sticking out from a cluster of bushes. I cautiously went forward, with my gun cocked ready for all emergencies. Step by step I advanced, and then the paw soon came as a reality and there in the bushes was the bear, stone dead. That was my first bear, but since then I have killed several, and never had to beat a retreat."

This was the half-breed's recital in substance, but if you could have heard it as he told it you would have been deeply interested. It was given with a crude and exciting eloquence, accompanied by an impressive gesticulation that held us spellbound till the narrative closed.

It was a melodrama at the camp-fire in one act.

"Kenosh," said Ned, "I was a participant in a bear adventure that resulted in my killing three bears without firing a single shot."

"Killed three bear without a shot?"

"Yes, sir."

"How?"

"It is too late to tell it now, but to-morrow evening I will give you the adventure complete."

"All right, me like to hear it."

Kenosh was somewhat taken aback at Ned's remarkable statement, but knowing him so well I was satisfied he had a fairy tale to weave, and that it would be surprisingly ingenious as well as distinctly novel, and make the half-breeds stare with open-eyed wonder.

We retired that night under a sky that was ablaze with twinkling stars, and just as the moon was rising o'er the tree tops and spreading itself like powdered silver over craggy pinnacles and on the moaning waters. The silent hours of the night wore away and then gray dawn streaked the east, and soon the bright rays of the sun glimmered o'er the horizon and dissipated all the daylight dullness, while the woods and waters flushed to roseate hues.

ALEX. STARBUCK.

[TO BE CONTINUED.]

PELEE ISLAND BASS FISHING.

TOLEDO, O., June 16.—*Editor Forest and Stream:* The complication in the Canadian fishing situation, about which you inquire, does not grow out of the license question, but out of the change in the close season. For a number of years the opening of the bass fishing in the waters about Pelee Island was fixed by a special "Order in Council" on May 15. At least we were always given to understand that such was the case, and the Chicago (Pelee) club and the Dayton and Toledo people were always on hand to begin promptly on that date. But four or five years ago we were told that the special order was not likely to be extended, and that we would be obliged to conform at Pelee to the general order for Ontario and Quebec, which fixes the beginning of the open season on June 15 instead of a month earlier (see page 56 of *Game Laws in Brief*, paragraph "Bass"). But eh! (beg pardon) the very cream of the bass fishing about the Lake Erie islands comes between May 15 and June 1, and all that is left after the 15th of the latter month is virtually nil. In an average season the bass are in excellent condition up to June 1; the water being still cold, and the development of spawn not having gone far enough to make such fishing objectionable. But no appeal or influence has thus far been able to secure a modification of the general order for the benefit of the Pelee fishermen. So you will see that the question of license does not

enter into the matter at all, as I understand it; but the grief of the situation is in being entirely shut out of Pelee and the adjacent Canada waters during the only month possible for spring fishing. Our understanding is that the license regulation does not affect anything but the border waters of Canada, and only those under certain conditions (see section 10 on page 60 of *Game Laws in Brief*). Those of us who were "domiciled" on Pelee, either in the club house or at a boarding house at the south end, never had any license to pay while paying board to Canadians and employing Canadian boats and men.

JAY BEEBE.

New Jersey Coast Fishing.

ASBURY PARK, N. J., June 16.—While fishing along the coast is not as good as has been experienced in seasons past, still enough bass and kingfish are being taken to keep the appetite of the angler up to the expectant degree. The four heaviest so far this season are to the credit of James Ronan, 20lbs.; Mart Rogers, 18lbs.; Wm. Moynan, familiarly known as the "bass king," and Charles Atkins, 13½lbs. each. More or less of the lighter weights are taken nearly every day from some point along the beach. In point of numbers, by far the greater part has fallen to the rod of Moynan. The local newspapers each season periodically display headlines such as "Moynan's Luck," "Moynan, the Lucky Fisherman," etc., which is simply rot—his eminent success being entirely due to his consummate skill and perfect knowledge of the habits of the quarry, coupled with an abundance of leisure time.

Manasquan inlet is affording some excellent sport. Dr. G. B. Herbert took six bass, weight 3 to 8lbs. respectively, and fifteen kingfish all at one tide one evening recently. The very poor facilities for procuring boats and bait at that point have long been a drawback. It is beyond doubt one of the very best fishing grounds along our coast.

There is a gathering of war clouds just now over Barnegat Bay. The law which prohibits fishing with nets between June and September the fishermen claim is oppressive and unjust, and they will resist all efforts to enforce the law. It appears to be a fact that already they have armed themselves and are prepared for the fray. To those people a word of advice may not be out of order: "Don't." While the territory is large and the number of wardens is inadequate to full protection, still the law as it stands is of such wise conception and its benefits so unquestioned that resistance such as proposed will be met by resistance and intolerance of a marked character. Barnegat Bay is the only natural spawning ground in our State left unpolluted, and the continued enforcement of the present law will prove of the greatest benefit in the future, as every year a very multitude of the young of the finest of our food fishes are nurtured in these waters. How long must it be ere the men who make their living and fortunes netting fish will learn that their prosperity depends on the protection of fish on their spawning grounds?

Just as I am writing this, "Uncle" George Brown, bending with the weight of his 93 years, brings to my office a magnificent bass of 18½lbs. weight, taken by himself from our pier. Although hooked and partially killed by him, his aged hand and feeble steps were not equal to the task of the fight to the finish and the rod was turned over to the masterly hand of Moynan, and the prize is secured. But to "Uncle" George the glory belongs, and who, after witnessing the glow of the eye and exultant bearing of this aged patriarch, could doubt that the love of the true angler is as lasting as life itself.

LEONARD HULIT.

FORKED RIVER, N. J., June 18.—On Tuesday, June 16, I caught forty-seven weakfish in Barnegat Bay, off the Waretown shore; the weight of the same was 2 and 3lbs.

M. CARROLL BAINES.

A Few Days in Maine Woods.

BOSTON, June 20.—I will briefly report my luck. There is a stream 'way down in Maine—the Auberton—that has yielded me fine returns for labor expended, and this year was no exception to the rule, although the weather was all against me. It had rained for three days before I got there, and it continued to rain at intervals the four days I was there. The ride down, although a long one, was delightfully cool, and the extensive Maine farms never looked better. Redington Mills, nine miles from Rangeley, was my destination, and I was cordially greeted by my friend Willis Eaton, the chief clerk of the corporation. He is also justice of the peace, postmaster and general head man of the settlement. The weather was extremely cold as well as rainy, and it was almost impossible to get near enough the main stream to fish it. However, I managed one day to strike them right, and took out a number of beauties in the pools just below the dam. These, with what I caught from the pond by permission of my aforesaid friend, made a handsome lot, of which several friends received their usual share. While at Redington Mills I saw several parties coming out from Rangeley, all of whom reported the fishing excellent.

WILLIAM B. SMART.

Sport with the Chinooks.

PORTLAND, Ore., June 13.—The boys are having great sport with the Chinook salmon at the falls of the Willamette. Good catches have been of almost daily occurrence for the past month, and the indications point to at least a fortnight more of it. To my mind this country affords no finer sport than a half hour's contest with a 20-pounder in the suds of the rapids below the falls. The strike can best be compared to a mild electric shock, while the contest "thrills as it fills every animate part," as all salmon fishermen who have hooked, played and properly landed one of these finny kings will readily testify.

My good friend, J. Roberts Mead, made quite a record yesterday. He went up to the falls not very early in the day and returned in time for his regular supper with twelve salmon of the aggregate weight of 132½lbs., all caught with spoon. Their weights in the order of capture were as follows: 20lbs., 15lbs., 6lbs., 20lbs., 17lbs., 18lbs., 21lbs., 10½lbs., 1½lbs., 7lbs., 8lbs., 7½lbs.

S. H. GREENE.

To Keep Minnows Alive.

I WAS told by one of the natives down at K. if I wanted good fishing to come down about the middle of April. So this spring A. and I planned a little trip down there.

We were out on the pond by 4:30 in the morning, and A. hadn't got his line in the water ten seconds before he had a good bite that made him hustle for a while. I was watching him land his fish when I got a bite that took up all my attention. How that old codger did pull! I finally got him into the boat, and we compared notes. A.'s weighed 2½ lbs. and mine weighed about 2 lbs. "Well," A. said, "if we can catch a few more of these fellows we're 'in it.'" We fished till breakfast time, half-past 6, and then weighed our catch. We found that we had taken together 28 lbs. of pickerel and ¾ lb. of perch. A. had caught twelve fish, together weighing 15 lbs. I had caught eleven fish, weighing together 13 lbs. and a little over.

We used live chub for bait, and found that we could keep them alive by simply keeping them rolled up in a wet blanket. This may be stale news for some fellows, but we found it out ourselves. Before we always used to keep them in a bucket full of water, and had to keep on changing the water or the little fellows would go to sleep.

F. E. J.

BOSTON, June 4.

Deed of Conveyance.

GIVEN a lake full of black bass, a lawyer and an insurance agent, a buckboard and horse, fishing tackle and other *impedimenta*, what will the result be?

This was the problem presented to us. The answer is hereinafter set forth and declared, that is to say: For and in consideration of the conjunction of the aforesaid prerequisites the said lake did forever release unto the said lawyer and agent forty black bass, as follows:

At the first cast, to the lawyer two bass of about 1 lb. each, thereafter in six more casts six more bass. Then to the agent in seven successive casts seven bass. Again to the lawyer in seven casts seven more; to the agent seven more in about forty casts, he having failed to connect thirty-three strikes, amid the direful imprecations of the lawyer. And so on to the full amount. Then we quit.

To have and to hold unto the said lawyer and insurance agent, their heirs and (not assigns) neighbors.

VICTORIA, TEX., June, 1896.

MARION WARNER.

An Ontario Fishing Center Wanted.

It is the intention of a few office companions and myself to spend a couple of weeks during the first part of July at some one of the numerous lakes or rivers back of Toronto, Canada, and as none of us have ever fished in the province, and as about all we can learn regarding the fishing and kinds of fish is through railroad ads. and folders, I would like to have some brother sportsman who knows these waters tell us where to go. We are all speckled or brook trout fishermen, and tossing the fly for black bass may also be classed as one of our choicest pleasures. We would like to know where we can find this kind of fishing, also would like to know if the trout of Lake Nipissing and Trout Lake and other lakes in the neighborhood of North Bay take kindly to the fly, and what flies are the most successful. If some good brother would like to enlighten us regarding the above and make our holiday an epoch we would be very grateful.

Box 102, OIL CRY, Pa.

ALLEGHENY.

Long Island Bluefishing.

BLUEFISHING has begun earlier than usual this year and large catches are reported every day. Last Saturday one boat in the Sheephead Bay, Long Island, fleet returned with a catch of thirty odd fish, one of which is reported to have weighed 12 lbs.

Last Sunday a party of seven, including myself, went out on the Cricket, Capt. Cowdrich, of Sheephead Bay, and in less than an hour after reaching the bluefish grounds we had six large fish. Owing to our limited experience in this kind of fishing a number of fish got away that should have been caught. Those that were landed were all pulled in by the captain, who certainly did all that was expected of him. The fish were all large, the smallest weighing 8 lbs. and the largest 10 lbs. before dressing.

We fished only a couple of hours because of the indisposition of several of the party, who quickly recovered when they reached *terra firma*.

G. F. DIEHL.

Large English Trout.

The *Fishing Gazette* of Aug. 4, 1888, thus describes the "monarch of the Itchen:" "Weight, 16 lbs. 2 oz.; length, 32 in.; circumference, 21 in.; bait, a live minnow; captor, Mr. Chas. Turpin; purchaser, a fishmonger; price, 20s.; future, a glass case."

Fishing Gazette of Oct. 6, 1888, records the capture of "a trout, 15½ lbs. in weight, caught on Friday last, near Overton, Hants, by W. Portal, Esq. Its girth round the shoulders was 20½ in. It is now in the hands of Mr. Rowland Ward, F. Z. S., of Piccadilly, where it can be seen."

Among records of Thames trout we have the following: 17 lbs. Jubilee trout, netted and returned, 1887; 16 lbs. 15 oz. Reading trout, April 24, 1880; 15 lbs., caught by Mr. R. Shaw, Marlow, May 11, 1863; 14 lbs. 9 oz., caught by Mr. J. Forbes, Chertsey, July 2, 1870; 14 lbs., caught by Mr. Ross Faulkner, Moulsey, May 21, 1883.—*Correspondence Fishing Gazette*.

The Connecticut Lakes.

PIKE STATION, N. H., June 16.—Trout fishing, both lake and brook, has been unusually good throughout northern New Hampshire this spring. Two members of our firm, who are also members of the Moosilauke League, have just gone to the Connecticut Lakes for a couple of weeks, where some unusual catches have been made this month.

E. B. P.

Carp Fishing.

FOR carp fishing use black bass hooks, 0 to 4. Grasshoppers, maggots, larvae of wasps are used for bait; also grains of wheat or barley, or pellets of wheat or corn bread mixed with cotton. Report your luck to FOREST AND STREAM.

Salmon Fishing

To let from July 1st for two rods on Grand Casapedia River, Quebec. The most famous and accessible salmon river in Canada. The sport this season has been superb. Largest run of fish for years. CASCAPEdia, care FOREST AND STREAM.—*Adv.*

Game and Fish Protection.

WASTE OF FOOD FISHES.

BY L. D. HUNTINGTON.

[Read before the American Fisheries Society.]

THE yearly waste of food fish along our coast is a subject deserving the consideration of all interested in the supply of healthy food. The subject should especially receive the careful attention of the citizens of the seaboard States. The waste from the indiscriminate use of the purse net by the menhaden fishermen along our coast, from Maine to North Carolina, demands proper attention and careful consideration. This industry, the products of which are guano and oil (from fish), is one of considerable importance; it is organized under the title of the "United States Menhaden Oil and Guano Association," with a capital of about \$2,000,000, employing from 2,000 to 2,500 men, with annual products of about \$500,000 or \$600,000 in guano, and about \$400,000 in oil; the capital, number of men employed and value of products varying somewhat yearly. This enterprise should receive proper consideration as a business venture, but not allowed to trespass upon the rights and privileges of the citizens of the seaboard States, by wasting the food products of the waters of the coast by converting them into guano. In the prosecution of their business (catching menhaden with purse nets) they not only intrude upon the rights of the citizens of the seaboard States, in catching and converting valuable food fishes into guano, but drive the food fish from their natural feeding grounds, and prevent the parent fish occupying their natural spawning beds and reproducing their kind.

While it is often denied by those interested in catching menhaden with purse nets that they catch any food fish worth mentioning, I will briefly state one or two of the many items of evidence of the catching and of the wanton waste of food fish by them. In 1892 a bill in the interest of the menhaden fishermen, known as the Laphan Bill, was before Congress, the provisions of which gave them the right to use the purse net all along the coast, in the bays, estuaries and rivers, limited only beyond the influence of the tide; the law, habits or customs of any State to the contrary notwithstanding. Strenuous efforts were made to secure this law, which fortunately failed, but it nevertheless furnishes the plainest evidence of their disposition to override all State laws for the protection of food fish, etc., in their pursuit of the menhaden.

At a hearing on this bill before a Senate committee the following instances of the waste of food fish were brought out: Mr. S. B. Miller, a fish dealer, in answer to questions asked him stated that he received at one time 70,000 lbs. of food fish, mostly weakfish, from one of Daniel Church's steamers, 10,000 lbs. of which went on the market; the balance, 60,000 lbs., went to the guano factory on Barren Island. He also stated that at another time he received from the same source another large lot of food fish, from out of which he selected about 10,000 lbs., that the balance of the lot were heated and unfit for sale, and that he told the captain of the boat to haul right out; of course these fish went to the factories. He further stated that with their (meaning the menhaden fishermen) manner of handling fish, the fish, after being covered in, with other fish as they are dumped in the hold of their vessels, would heat and be unfit for use for food in three hours or less.

Mr. E. G. Blackford, the well-known fish dealer of Fulton Market, before same committee stated that from his own knowledge every year those fishes which feed upon menhaden grow more scarce; that there had been several instances which had been spoken of there, of his own knowledge, where the menhaden vessels have taken large schools of food fish and have brought them to market; the very large catch of 1891, about a year ago, just about that time of the year, were principally of weakfish. Some four or more vessels came up to Fulton Market with a cargo or quantity of at least 200,000 lbs., nearly all weakfish, and out of that 200,000 lbs. about one-quarter were marketed, the balance of these cargoes was sent to the factories and rendered into oil and scrap. Mr. Blackford further stated that in his opinion the effect of the great amount of fishing that is carried on for menhaden all along the coast breaks up the schools of fish which are followed by the striped bass and bluefish, and has a tendency to make these fish seek other feeding grounds.

Mr. George Hildreth, of New Jersey, formerly a menhaden fisherman, in answer to the following question, *i. e.*: "Well, on the average would there be considerable food fish?" replied, "There would sometimes be quite a number of food fish among them (meaning menhaden), and other times very little—whatever there was within the bounds of the net." In connection with the latter part of Mr. Hildreth's answer, that the purse net caught whatever there was within its bounds, I will quote Prof. G. Brown Goode, endorsement (Mis. Doen. 49, Second Session, Forty-fifth Congress, page 117). He says, "The purse seine is doubtless more effective than any other fishing apparatus ever devised; by its use a school of almost any size can be secured without the loss of a single fish." The enormous demand of the oil factories can be met only by fisheries conducted upon the grandest scale, and the purse seine is used by the factory fleet to the exclusion of all other nets.

The purse net, as Prof. G. Brown Goode and Mr. Hildreth say, takes all fish within its inclosure or bounds, which must necessarily include the taking of a very large quantity of food fish in its use in taking the average yearly catch of 500,000,000 of menhaden.

Agreeable to statement compiled by Hugh M. Smith and published in the United States Fish Commission Bulletin is given the number of hauls made by two menhaden steamers for one season as 1,078 and the proportion of the catch as one-twentieth of the menhaden taken for that time; this would give a total of 21,560 hauls made in a season from the best available data on the subject. The average length of the purse nets used by the menhaden fishermen is about 1,360 ft. Taking the average length of the nets used as 1,350 ft., each haul would inclose 3½ acres, which makes an aggregate of 61,589 acres of water along our coast, bays and estuaries upon the feeding and spawning grounds of many of our valuable food fishes thoroughly screened of the food fish yearly. The food fish so taken are hastily dumped by steam power by scoops holding five barrels each in a mass in the hold of a vessel (precluding the possibility of detecting the various

species of fish taken with the menhaden, even if desired), where they soon sour and become unfit for food; taken to the factories and rendered into oil and guano. As before stated, it is claimed by many interested in the menhaden fishery that they take but few if any food fish with the purse net, while taking yearly about 500,000,000 menhaden. Those who are familiar with the purse net and not interested in the menhaden oil and guano business have yet to learn how it is possible for the net to take the menhaden without taking the food fish it incloses, especially when the depth of the water does not exceed that of the net used, so that it reaches to the bottom and incloses a certain space of water, forming a flexible wall from the surface to the bottom, then being pursed up along the bottom. I would ask how it is possible for the food fish to escape and the menhaden only taken. Aside from the waste of the food fish so taken, the indiscriminate use of the purse net in the shallow waters along the coast, in the bays, inlets and estuaries—the natural feeding and spawning grounds of many of our valuable food fish—drives them to other localities and seriously affects their natural reproduction.

From such statements of the value of the yearly products as I have seen in print, the proportion gives about 60 per cent. in guano and about 40 per cent. in oil. Food fish rendered may not add to the product of oil, but do to the product of guano. The subject of coast food fish supply is one that should especially interest the hundreds of thousands of citizens of the seaboard States; that the present waste of food fish from the indiscriminate use of the purse net by the menhaden fishermen within the three-mile limit is an abuse of the rights of all citizens. No business is justified in using food fish, which were intended for food for the people, for the purpose of manufacturing into fertilizers; nor is any business justified the prosecution of which in any way interferes with the people's supply of food fish. There should be proper restrictions that would be just to all—to the menhaden industry as well as to millions of hard-working citizens who depend upon the continual food fish supply for a livelihood, the many thousands who at times take fish for food for their families, the many thousands who of choice prefer to catch their supply of food fish from the waters adjacent to them instead of from the market, as well as thousands who resort to the waters along the coast for food fish as well as for recreation and health. The food fish should be protected within the three-mile limit before it is too late. If the use of the purse net was properly restricted or prohibited within a reasonable distance from the shores, and used only in waters beyond the depth of the net used, it would go far to stop the present waste and to insure a continued supply, now so seriously threatened.

I would most respectfully ask the consideration of the members of this Society, and especially those who are Commissioners of Fisheries of the respective seaboard States, to this important question.

DOG AND PICTURE.

Editor Forest and Stream:

I note with much pleasure A Posteriori's comments upon my insistence, with illustration from real dog life, that a dog may have—that at least one dog has—the power to cognize a portrait.

He says: "I think an isolated incident should not be taken as proving that such high perception is common to the whole race of dogs."

True, such an incident should not be so taken. Tiger is a genius; but the genius has no additional faculty. Shakespeare was only more highly endowed with the faculties of which the average man has some. Tiger cognizing a portrait, it is evident that the powers by which a portrait is cognized are not man's alone. Man shares them with the lower animal. The day is gone by when the great man is thought to be any more descended from the gods than is any other man. A few years before The Christ, Julius Cæsar was thought to be, within two or three generations, the son of Venus and Anchises. To-day we would find it rather hard to have the average American care who his parents were. True, there are some sons of their fathers; but the genius of America is to take every man for what he is himself. Is man descended or ascended from the lower animal, or was he immediately made by the Creator? We are coming to care less and less. We take man as we find him. And I find myself finding him with no essential difference between him and the rest of sentient beings. So with Tiger, a genius! But not essentially different from other dogs.

Again he says: "This is a point on which the observations of your numerous readers would be invaluable, in establishing whether the dog's cognition is of such a high

order that he really recognized a portrait, or that he considered the portrait as being his master in his own proper person. If he mistook the portrait for his master, he simply betrayed stupidity; for the skill of the artist deceived the dog. In other words, the dog did not recognize any portrait; he recognized only his master himself from a false cognition."

Then a dog can cognize not only objective but also subjective things—a fact for the cognition of which by man I have made a hard fight through the years—to me a fight of love—something which A Posteriori, with the keenness of perception which is evidently his, cognizes perfectly; for earlier in the letter under consideration he says: "There is no doubt but what the dog is a keen observer of emotion." The very fact that the dog could make "a false cognition" is all the evidence necessary that he has the power of cognition—cognition of a portrait as well as of a man. Suppose that he was deceived—that shows his "stupidity" no more than the stupidity of the artist was shown by his trying to flick a fly from his painting, which fly had been painted there while he was out, by a brother artist. The very attempt of the highest order of artist is to deceive the observer. Could he produce a portrait that would be mistaken for its original, his fortune would be made, and he would be unable to sleep for joy; might be killed by it, if joy ever does kill.

But A Posteriori's objection is not well taken, from the fact that Tiger did know the difference between the portrait of his master and that master. This is abundantly proven by the fact that he, when the master spoke, though he weighs 105lbs., jumped upon the master and fondled him.

Did Tiger again look at the portrait in the presence of his master? If he did, he knew that it was not his master. Suppose that master away, might not then the portrait bring the master to Tiger's mind, as it might bring the husband to the wife's mind?

I might go on drawing inferences. But notwithstanding philosophy—and the same is largely true of science—is builded upon inferences, there are those—of whom A Posteriori is not one—who are always dodging behind the statement that one has no right to draw an inference. Nor drawing inferences, then, I think that Tiger clearly knew the difference between his master and that master's portrait—a statement which I repeat, because it is the point at issue.

I think that A Posteriori is mistaken when he says that his mongrel bull terrier did not cognize or recognize himself in the reflection in the mirror. What are the facts? When he saw the reflection he made for it. When he came, physically or mentally, in contact with the glass, he passed around the obstruction. When he found no dog back of the mirror he was abashed. Abashed at what? At "being the subject," as A Posteriori says, "of much amusement. Yes, he had made a fool of himself. He knew it. How? I would say by discovering that he had made an attack upon a reflection of himself. This could have been easily established by placing the mirror in other positions. The child, first seeing the reflection of itself in a mirror, thinks that reflection another child; but it comes to know that it is a reflection, and a reflection of itself. And the same thing seems to me quite certain in the case of the dog. CHARLES JOSIAH ADAMS.

29 LAFAYETTE PLACE, New York City.

The Age of Kennel Progress.

NEWARK, N. J.—*Editor Forest and Stream:* The dog which ate glass bottles and other forms of bright delicatessen had his day, as every other dog is said to have. He did very well as a remarkable dog of the age in which he lived. Following the glass bottle age of the dog came the iron ramrod age, for at that period in the annals of dog history is recounted the doings of the dog which ate the iron ramrod. The iron rod was too straight and too refractory for even the digestive organs of a dog which played no favorites in the way of diet. Still, once in his stomach, the control of the ramrod ceased so far as the volition of the dog had any importance.

Then, so the story goes, the ramrod worked its way perpendicularly through the dog's back, and so firmly set was it that it was impossible to work it forward or back. It was the cause of a thousand misfortunes to the dog, and, were his constitution other than the best or his digestive organs other than the toughest and firmest, he would either have been killed outright or died from a weakening of his vital forces.

A learned veterinarian, who attempted to treat him said that so long as the diastole of his bones was not affected, the etiology of the case would be in a state of inertia, and that therefore the dog should be fed on solid food.

Often, in chasing intrusive dogs from this master's country premises, they would escape by running under a rail fence, when in pursuit the guardian dog's iron dorsal spine would catch, bringing the dog up with a most cruel wrench, or when his momentum was greater, ripping the bottom of the fence out. His comfort, too, was abridged, for the measure of his enjoyment under the kitchen stove in winter was the length of his body up to the ramrod. After warming his head and shoulders to his satisfaction he would turn about back under the stove as far as the ramrod would permit, and thus maintain an equal temperature to his body. I consider this one of the most striking proofs of the dog's powers of cognition and reflection, and I commend it to the attention of your readers who are interested in comparative psychology. Of course, it cut off the dog's privileges as a pet or lap dog, for no one cared to have a dog jumping about him with an iron ramrod in his back.

After the dog's death a *post-mortem* showed that the ramrod had, in working its way out, penetrated the heart and both lungs of the dog, yet the pathological symptoms were normal at all times of the dog's life. And yet again it was remarkable only for its time and place in history.

And now comes the true story of one Gladys III., owned by Col. Cornwall Leigh, which swallowed a wooden skewer 4½ in. in length in 1894, which forced its way out between the ribs of the bitch on June 3, 1896. In the meantime the bitch worked afield to her owner's satisfaction, attended to the duties of maternity without any annoyance, save that she seemed to get out of condition and was in a decline. So up to the present time there is the bottle dog, the ramrod dog and the skewer dog in the annals of the kennel world. One swallow does not make a summer, but it makes a dog famous.

TRUTHFUL JAMES.

SANCHO.

A doe? Ah, yes. He knew it well,
And yet his dignity ne'er fell
To currish trick or idle growl,
Nor did he ever deign to howl.

A bark had he for every mood,
And we who knew him understood.
Our friends were his for fourteen years.
He sleeps where flowers distill their tears.

MAPLE CORNER, Willington, Conn., June 4. ANNIE A. PRESTON.

[Mrs. Preston writes: "Our dear little pet beagle Sancha died the other day. I want another nice dog. Do they ever give away puppies at any of the kennels? I cannot afford to buy a dog, but we would take the best of care of one. We are very fond of pets."]

ALL-AGED STAKES AND FIRST PRIZE WINNERS.

THE origin of the new rule of the U. S. F. T. Club, which practically gives the all-aged stake the unlimited competition of a free-for-all, is in a very small beginning and has a very small following in the way of supporters. As is well known among sportsmen, the United States Field Trial Club, at its meeting held at West Point, February, this year, enlarged its ruling concerning the eligibility of first prize winners. After a dog had won one first prize, under the old ruling, he was ineligible to further competition in the all-aged stake of the U. S. F. T. C. Incidentally it may be mentioned that such is the ruling of all other clubs, and such it has been for many years. Under the new ruling dogs are eligible to compete in the all-aged stake of the U. S. F. T. C. till such times as they have won two first prizes in all-aged stakes.

As it was possible that the club, on sober second thought, might reconsider its ruling on the matter under consideration, as had been done previously by another club, criticism of the new ruling was deferred by us in the hope that the club would perceive and rectify its error. Indeed, it is not too late for it to do so now. That it is a harmful ruling as it stands, and is a perversion of the purposes of field trials, it is not a difficult matter to show. Our criticism is directed against it as an error of judgment on the part of the club.

There was no popular sentiment in favor of the new ruling. In fact, the whole movement in favor of letting down the bars to all-aged winners was the outcome of the personal advocacy of Mr. J. M. Avent, in his efforts to improve field trials. To change the old ruling so that first prize winners would have greater opportunities in the competition was a pet measure of Mr. Avent's, which he advocated as early as 1893. His first attempts were failures. However, in 1894 he met with better success. He was the leader in inducing the Manitoba Field Trials Club to rule that dogs were not ineligible to the club's all-aged stakes till they had won two firsts in all-aged stakes, Mr. Avent being a member of that club. But that club, the following year, before its entries closed, rescinded the new rule and returned to the old one.

In 1895, at the February meeting of the U. S. F. T. C., Mr. Avent advocated the changing of the old rule so that it would permit dogs to have two wins in all-aged stakes before they were ineligible in such stakes. There was such a strong opposition against the proposed change, notably from old and new members alike, that the attempt apparently was given up; however, it was so in appearance only.

Under more favorable conditions, at the February meeting of the U. S. F. T. C. this year, Mr. Avent's long-pending measure for the betterment of first prize winners was adopted, so that now under the U. S. F. T. Club's rules dogs are eligible to compete in that club's all-aged stake till they have won twice in all-aged stakes. Thus the measure, which had no adherents of any note in 1893 save Mr. Avent, received the U. S. Club's approval in 1896 and was adopted by it. It was thus largely a personal measure throughout. It was legislation in favor of the few who owned first prize winners, for it gave the owners of such winners a great, an inestimable advantage over those who did not own first prize winners, in that it gave dogs of known excellence an opportunity to compete on even terms with green dogs. It practically removed all protection from the stake. As hereinbefore mentioned, there was no popular sentiment to support such a change in the ruling. It was simply an object lesson in respect to the incompatibility of the professional's private interests and his duties as a club member. This is a matter of interest to all those who have the welfare of field trials at heart or a sense of fair play in matters of field trial competition.

The First Prize Winner.

The matter of first prize winners in competition engaged the attention of field trial clubs when they were comparatively in their infancy. It was found necessary, even in that early day, to make a dog ineligible to further competition in an all-aged stake after his first win in it. The success of field trials made the limitation of the all-aged winner's competition absolutely necessary. This, contrary to the argument of a very small minority, inflicted no hardship on the first prize winner, for the reason that he had his opportunity to exhibit his high capabilities in public competition; the utmost publicity is given to his merits; he is conceded the honors of victory won with some material prizes worthy of consideration, and his fame lives on in the records through future ages. The well-known competitive capabilities of a first prize winner, if there were no restrictions on his competition, would result in owners keeping their dogs out of all-aged stakes in which such first prize winners were entered. It required but a few years of field trial experience to convince field trial managers that the winnings of a dog in competition in an all-aged stake should be limited to one. As the years passed and field trials multiplied the list of all-aged winners constantly increased. If they were permitted to compete in the all-aged stakes it would decrease the entries to a serious extent, for no man of sense would care to enter a green dog against a number of dogs of approved merit in competition. To relieve the strain thus produced, the championship stake was inaugurated. While the first prize winners were always reasonably certain to appear in the all-aged stake when there was an opportunity to do so, they never manifested any great craving for competition with each other. Very few champion stakes have been a success from the financial standpoint of the field trial clubs which gave them.

As time passed, there came many changes in field trial matters. Clubs have come into being and after more or

less success have passed away. The personnel of the few remaining clubs which have survived from the beginning has greatly changed, and there are still greater changes in the different managements. As time passed, the old lessons were more or less forgotten and history has made an attempt to repeat itself; for with the passage of time the old field trial troubles and their causes were left in the past beyond the knowledge of the newer comers or were forgotten or disregarded by those who should have remembered them.

What are Field Trials for?

In considering what field trials are for, it may not be out of place to consider what they are not for, in so far as they are not an institution for the purpose solely of creating a revenue. The revenue for their support and the prestige which gives them respect from the world at large comes from the sportsmen who band together into field trial clubs. Aside from the pleasure of annual reunion and the satisfaction in promoting a sport in which they are enthusiastic, they derive no other return from their expenditure and their efforts. If any man were to ask such club members to so arrange the club's stakes that the latter would be for revenue purely, and not for sport and the improvement of the dog, there is no uncertainty as to the answer. But the same thing is brought about in effect by evasion and false issues. In pleading the needs of the first prize winner for further competition, it is set forth that a good dog after he has won first in an all-aged stake is practically of no further use to his owner, and that his owner thus suffers a hardship in not being able to run such winner in the field trials and have a chance at the club's money. In other words, their dogs' merits having already been determined by competition, yet they ask that they be permitted to make the trials a means of revenue. It is also an admission that the owner has no personal use for his dog apart from trials.

Furthermore, it has been advanced that there are owners of first prize winners who brag exceedingly of their dogs' merits, and who profess great anxiety to compete in field trials, and plead that they cannot do so under the restrictions. As to who these parties are, there is an absence of statement in good keeping with the feebleness of the argument and its juvenile nature. Were it not advanced by one who poses as an advocate of the best interests of field trials, it would be undeserving of serious answer.

First of all, in respect to field trials, the first prize winner has no further claim whatever on an all-aged stake. He has derived all the benefits of honor and record by one or more wins, so that so far as the public is concerned his further winning would determine nothing. His further running in an all-aged stake would be a run for revenue. In furnishing a dog a means by competition to establish his merit the club serves a public purpose. The club should not be expected to abandon its mission, the general improvement of the dog, and divert its money and efforts to maintaining a revenue for the dogs which have already gotten out of field trials all that they are entitled to. If the owner is not satisfied that his dog has demonstrated his merit to a satisfactory degree, he has the champion stake at his service.

Stripped of all sophisms and subterfuges, the opening of the all-aged stake to first prize winners is making the stake a source of revenue to the first prize winners. As concerns the booster afore-mentioned, field trials are not run with reference to silencing boosters, for men can boast regardless of field trials or their doings, and if the man who has a winner has not a right to feel proud of it, then when should he have the right?

Let us now consider what a field trial club is for. The club gives prizes of sufficient value to reward the efforts of the contestants and give the competition value. The competition is conducted under established rules and set forms. The judges are selected with a view to their skillfulness and their fame and reliability. The club gives the competition prestige, and all these different factors give the wins a value in the records and gain the esteem of the public.

The life of a dog is short. So soon do dogs pass away that constant effort is necessary to keep up the standard of perfection or the nearest which we have to it. As the best dogs of this year are brought out and receive the stamp of approval by being awarded the first prize and honors in a competition, the mission of the club, so far as the best dog of the year is concerned, is done. The dogs of next year will require the same attention, for the dogs of this year will soon pass away, as will the dogs of next year in their turn pass away. If the best standards are kept before the public, there must be unceasing effort from year to year. If from putting unnecessary obstacles in the way of owners their efforts are lessened or they cease all effort, the general good suffers accordingly. As to the winners other than first, it may be asked why they are not barred too, as the same remarks might in a way be said to apply to them. In reply, the public never has made any objection to them that required that they should be barred. The ruling of all clubs never dealt with the second prize and other winners as being objectionable in the sense of a first prize winner. The second prize winner is short of the honor that all really desire, and the full benefits of the all-aged stake are not obtained till the first prize is won. On the contrary, the first prize winner has derived all the benefit from the all-aged stake that it possesses. Further competition could place him no higher—it would simply add to the number of his wins; the degree would be no different.

But in considering the first prize winner as if he were an individual dog, it is well to consider that there are a great many first prize winners.

It is commonly held that there is a great element of chance in a field trial competition. There is an element of chance as between dogs of equal or nearly equal merit; but when the bars are thrown down to the first prize winners the element of chance is entirely eliminated. The records will show that certain dogs have won a place in almost every trial in which they ever competed. As there are three or four great trials every year, affording a dog an opportunity to compete in three or four all-aged stakes, there is ample opportunity to display his merit. In these trials it is not an uncommon happening that two or three different dogs are placed somewhere in the money at every one of these trials. If they were permitted to compete till old age supervened, it is easily apparent that they would drive untried dogs out of the competition. The fact that they would drive out the untried dogs is proof in itself that the winning dogs have demonstrated to public satisfaction all that the trials were in-

tended for: that is, in accordance with the constitution of the different field trial clubs, not one of which states that they are for the purpose of creating a revenue for first prize winners.

To permit the first prize winners to compete till such times as they will win two firsts is practically to permit them to compete all their lives, for there are many more first prize winners than there are first prizes. The first prize winners added to the second and third prize winners make a competition against which a man with only one or two dogs would be foolish to compete. It would encourage handlers to gather together strings of winners to campaign through the circuit with no other purpose than to capture the prizes. If one handler attempted to campaign a string of winners the other handlers would have to follow the same policy in self-defense. The purposes of the trials in developing the dogs of the year and of the future would be neutralized.

In this connection the precedents are worthy of careful consideration. The first prize winner has been barred from the all-aged stakes for many years past by the great field trial clubs of the country. Indeed, the U. S. F. T. C. turned a deaf ear to the pet measure of Mr. Avent till the present year. The rules of other clubs are specific and explicit on the subject, and there is a uniformity throughout save in the one instance of this club. It seems like a suicidal policy to follow when it is so apparent that it is a policy that will work the club an injury, irreparable if persisted in.

In nearly all forms of competition a handicap obtains. We observe the attempt to establish an equity in the competition of horse races, bicycle races, trap-shooting, etc. All such forms of sport have a means of establishing a handicap. They have some means of making difficulties for the contestant of known great ability greater than the common. In field trials there is no means of establishing a handicap. The conditions governing the pursuit of birds do not admit of it. The only way is to give a dog every opportunity to make his reputation in the all-aged stake, then bar him from it. As said before, if he seeks further reputation, there is ample opportunity in the champion stake.

The dog or man who is in the competition solely for the revenue he may derive from it is of no special benefit to field trials, the more so if he is both a professional handler, breeder and club member. The temptation will be to make the different interests as near one interest as may be, and that interest is in the direction of revenue for his own personal profit.

It is well worth while for the U. S. F. T. C. to reconsider a matter which has a support, not from the field trial supporters at large, but from a source which is so small as hardly meriting to be dignified with the term minority.

A REDUCTION IN EXPRESS RATES.

THE breeders of dogs will learn with no little gratification that the express rates on bitches, which are shipped to distant points to be bred, are cut down one-half—that is, when one full rate has been paid the bitch is returned free. A double first-class rate as heretofore is maintained, but as there are now no return charges there is an enormous saving in the expense of shipping. It removes a serious obstacle to the interests of the kennel world.

This result was brought about through the efforts of Mr. Robt. H. Burrows, proprietor of the Seaforth Kennels, East Orange, N. J., and Mr. Dudley E. Waters, Grand Rapids, Mich. Much credit is due these gentlemen for their skillful management of the matter and its successful issue. They began their efforts in the matter during the New York show, visiting in person the managers of the express companies and explaining to them the express features of the kennel world, and showing how the present rates were detrimental both to the kennel world and their own interests, as owners could not afford to ship, and with no shipment or small shipment the companies suffered a corresponding loss of revenue. The companies which have granted the new rate are as follows: United States Express Co., Wells, Fargo & Co., American Express Co., Adams Express Co. and National Express Co. This was after the matter had been considered by the Traffic Association, so that it virtually is a concession from all express companies, as the above mentioned control many of the smaller lines. The following is a copy of the letter, dated March 9, on which the concession was granted, and which was sent to the managers of the different companies, and forms the official beginning of their records on the subject:

"Referring to our conversation on the 24th ultimo, when we asked for a reduction on the express rates on dogs to apply to bitches sent for service only, we now beg to again put the matter before you as briefly as possible.

"There are very few first-class stud dogs in this country, and those few are at wide distances apart, and therefore your present charge of double first-class rates on bitches, both to and from the stud dogs, added to the stud fees, entails an expense on breeders which not one in fifty can stand, and the result is that owners of bitches are compelled to let them pass over or breed them to local dogs, simply because they cannot afford to send them to a good and suitable stud dog that may be anywhere from 200 to 1,000 miles away. Now you can readily understand that every owner of a bitch takes pride in her, and would like to breed her to a first-class dog; but when he discovers the heavy express charges for sending her to the dog of his choice and having her returned after service, he invariably is deterred from doing so on account of the great expense.

"Now we have to ask if you will make the rate on bitches sent for service the same as on all dogs sent to shows, viz.: double first-class rate one way and return them free, and by so doing we feel sure the companies will benefit to a much greater extent than by the present system, on account of the greater number of bitches they would be called upon to carry, and not only that, the puppies from such unions would be readily sold, and the companies would transfer them to all parts of the country. As it is now, bitches with very few exceptions are bred to local and unsuitable dogs, and the offspring being inferior is destroyed or disposed of in the immediate neighborhood, so that the express companies get nothing out of it, and instead of the breed being improved, as all lovers of dogs desire, the reverse takes place.

"By the plan that we propose the express company cannot be deceived, for the double first-class rate to the stud dog has to be paid in advance, and then if for any reason

the bitch is not returned, the company is so much better off, as it has received full pay for the service performed.

"Your present rate, you can readily see, operates especially against the large varieties of dogs, such as St. Bernards, etc., in which we are directly interested.

"A St. Bernard bitch, when crated for a journey by express, will weigh, as a rule, from 200 to 250 lbs., and the expressage for sending such an animal to a stud dog is by far greater than it would be for the smaller varieties.

"The breeding season has just commenced, and if you can give our application your early attention we are sure it will be for the good of all concerned.

"Hoping that you will grant the modification we ask for, and assuring you that if you do so we will take it upon ourselves to see that it is well advertised, we remain very truly yours,

DUDLEY E. WATERS,
Grand Rapids, Mich.
ROBT. H. BURROWS,
Seaforth Kennels, East Orange, N. J."

To this replies came favorably from the different managers, the last one under date of June 17.

Since the foregoing was set in type, we have received the following from Mr. Waters:

OAKHURST, Grand Rapids, Mich., June 16.—*Editor Forest and Stream:* For a number of months I have been making an effort to obtain a reduction in the express rates on bitches sent for service, and I have to-day been notified of my success. My first effort was through the local express agents, and receiving but little encouragement I determined to go to headquarters. When attending the Westminster show February last I interested Mr. Robert H. Burroughs, owner of the Seaforth Kennels, East Orange. I called at the office of the A. K. C. and was assured by Mr. Vredenburg that an effort to get any reduction in express rates for bitches sent for service would be fruitless, and reviewed with him carefully the report of the express committee of the A. K. C. published in the *Gazette* of September, 1892. I concluded the A. K. C. could give me no aid, and with Mr. Burroughs went on a still-hunt, making as little noise as possible and presenting arguments we thought most likely to win. Together we called upon the traffic committee, composed of Messrs. Zimmerman, superintendent of traffic of the Adams Express Co.; Dudley Evans, vice-president of the Wells, Fargo & Co. Express Co.; T. A. Ritson, general manager of the American Express Co.; C. T. Thayer, general agent of the United States Express Co., and G. W. Slingerland, traffic manager of the National Express Co. We spent a part of two days calling upon these gentlemen, and stated our case to them. We were received most courteously, and listened to with interest. We were assured by them individually that our matter would be taken up and acted upon at a meeting of the traffic committee. We were advised to write each member a personal letter, stating our side of the case carefully. This we did, as follows [here follows the copy of letter published above].

Since that time I have written a number of letters to members of the committee. Mr. Burroughs has called on them, and their representatives have called on me several times. Upon my return from Chicago this morning I was very much gratified at finding a letter from Col. Dudley Evans, vice-president and manager of the Wells, Fargo & Co. Express Company, which reads as follows:

NEW YORK, June 12.—Mr. Dudley E. Waters, Grand Rapids, Mich. Dear Sir: Referring to your application of March 9, 1896, for rate on bitches sent for service, it was agreed at the last meeting of the Traffic Committee that they could be returned free when double rates had been paid going. This took effect on the 10th instant. Yours truly, Dudley Evans, Manager.

This is the meat of the nut we have cracked, and means that when breeders ship bitches to a stud dog they will have to pay only one-half of what they did before this reduction took effect.

DUDLEY E. WATERS.

Central Beagle Club.

SHARPSBURG, Pa., June 22.—*Editor Forest and Stream:* The field trial committee of the Central Beagle Club met on Friday evening. The grounds have not yet been selected, the club having under consideration fields at Rice's Landing, Waynesburg and others. The selection will be made at the next meeting. The running rules of the club are now out. The field trials will be run on the percentage plan. The club will only take 10 per cent.; the rest goes to the winners. The secretary has received offers of several valuable special prizes for the field trials, and everything points to a favorable day. A number of applications for membership have been received lately and will be presented at the next meeting. SECRETARY.

POINTS AND FLUSHES.

The following item is from the daily press: "A small black dog become mad, as is supposed, early in the morning of June 13, in the excitement of worrying a cat, and was shot by a policeman in the basement of No. 5 Suffolk street. The dog had chased the cat in and out of alleys and basements until the feline took refuge on the window sill of No. 5 Suffolk street. Failure to dislodge the cat by continued barking drove the dog into a fit, and he at last went mad, it is thought. He ran about the street for a while, but soon jumped into the basement of the house where the cat was. Policeman Rohrbach, of the Delancey street station, had been following him, and in the basement fired at him five times with his revolver. One shot hit the dog in the back, another in the neck, a third in one of the forelegs, a fourth in one of the hindlegs, and a fifth, the fatal one, in the head." The dog had a fit, and forthwith the cry of mad dog was raised. It is the same old story of ignorance and cruelty. There is an object lesson, however, of the benefits of pistol practice, for the policeman with his pistol could kill the dog after a while instead of shooting through second-story windows or through innocent passers-by.

Those who may be interested in the Dogue de Bordeaux, which from its appearance is a direct cross between the mastiff, bull dog and terrier, will be pleased with a pamphlet devoted thereto, just published by M. Megnin, editor of *L'Eleveur* (Vincennes), a French journal devoted to field sports. It need scarcely be said that the "dogue" takes its name from the town of Bordeaux, where it is supposed to flourish again. It is kept for fighting and for guard purposes, and not, as is generally supposed, as

a beast of burden. The strong limbs and great power might make it useful in drawing light carts, but we are afraid its disposition is against any utilization for such a purpose. The pamphlet in question contains several portraits of leading examples of the breed, which appear to vary very much in type, one favoring the mastiff, another the bull dog, while still a third bears certain characteristics of the Great Dane. The "dogue de Bordeaux" has its ears cropped, and this, with its general ugliness, is against its adoption as a favorite in this country.—*London Field.*

Toronto dog show will not after all be compelled to use a tent this fall, as arrangements have been completed to retain the show at the old stand, commodious and airy.—*Canadian Kennel Gazette.*

Field trial supporters should not overlook the chicken trials, and that the Derby entries of the Manitoba Field Trials Club close on July 1. Entrance fee, \$5; \$10 additional to start. John Wootton, secretary, Manitou, Man.

The Ladies' Kennel Association's bench show was held on June 11 and 12 at Holland Park. It was successfully conducted, and was favored with the best of weather. It is regrettable that America cannot boast of a similar organization.

The *British Fancier* comes to us in a new dress and a colored cover this week, bright and artistic in all its details, as is fitting in a change from Manchester to London.

Mr. James B. Blossom, New York, writes us as follows under date of June 20: "I have lately obtained an Irish setter bred by Mr. Brian McSweeney, of Annamore, Ireland, where he won second in open and first in novice class at Cork last autumn. He is by Chief (Kinsale, E. 20,442—Nellie X.) out of Queen (Grouse VIII.—Fanny), and not yet 2 years old; of the darkest, most superb red I ever saw (bar none); magnificent feather of same color as coat (a rarity); very powerful in build, deep-chested, and active as a cat. But I value him most highly because of the opportunity to breed him to some of my Bedford and champions Kildare and Elcho bitches. He promises well in the field, and the infusion of new blood ought to result in great benefit."

It would be a decided gratification to us if Mrs. Preston's note, on page 520, should prompt some one of our readers to supply for the place of her lost Sancho another dog worthy of the home and affection he would be given at Maple Corner.

S 29. Stamford, special, Stamford, L. I. Sound.
29. Pavonia, An., Communipaw, New York Bay.
S 30. Indian Harbor, special, Greenwich, L. I. Sound.

Our opponent, the *Marine Journal*, having given up the fight over steam, now turns its attention to sail, as follows:

Seldom has the New York Y. C. had a finer racing day for their annual regatta than that of last week, when they had all the wind wanted, steady and true, with sunshine too. This regatta leads the events in the season's yachting and is only exceeded in interest, except when there is an international contest, by the annual cruise of the same club's squadron at a later date. The appearance of the Lower Bay, with the fleet of sloops and schooners eagerly doing their level best on every point of sailing, was a sight not to be surpassed in beauty anywhere. Whatever opinions may be held about the relative merits of American and foreign-built yachts, there can be only one opinion as to the superlative excellence of our sailing craft, the New York Club yachts being almost without exception native products and unsurpassed for speed and excellence. Considerable interest was evinced in the late event as to the performance of the *Colonia* in her new schooner rig. She was only beaten one and one-half minutes on the course and can undoubtedly do better in the future.

Apart from the fact that not a sloop started in the New York Y. C. regatta, every single-stick yacht being a cutter, the above statement is quite correct. The *Marine Journal*, however, fails to point the moral of this superiority of the American sailing yacht over the British.

Through certain peculiar circumstances sailing yachts of such a size as to be sailed across the ocean have for years been entirely free from the action of those tariff laws which apply to almost all imported articles, and a unique and most instructive experiment in free trade has consequently been possible. At the outset the American article was decidedly inferior in quality to the British, and quite as costly. At the time when the demand for a better class of vessel than the old cut-nail and soft-wood sloop was first felt about New York, the British cutter could be freely imported, and a superior yacht could be had at a less price than the home-built craft. The sole result of this free competition for some fifteen years has been not the ruin of American builders, but the production of a new national type of sailing yacht that has proved far faster than anything yet produced on the other side; the growth of such building yards as Lawley's in Boston, Herreshoff's in Bristol, and scores of smaller plants equally perfect in their way, and the opening of a growing market abroad for American yachts. As for foreign competition and the underselling of American workmen by the products of cheap labor, no one now cares to import a British sailing yacht, duty or no duty; natural causes, unhampered by ignorant and partisan legislation, have simply worked out for themselves the desired result. So far as the industry of designing and building sailing yachts is concerned, it has, under a policy of absolute free trade, achieved its own legitimate protection through the superior ability of American designers and builders. We hope that the *Marine Journal*, as the self-elected exponent of protection carried to the point of exclusion, will not deem this thoroughly practical experiment beneath its notice and discussion.

ONE of the difficulties existing in American racing, the great number of classes for which courses and prizes must be provided by the clubs, is well shown in the regatta of the Larchmont Y. C. on Saturday. The 60 starters were divided among no less than 18 different classes, most of them with one, two or three starters each. Deduct-

ing the 30ft. class and the 15ft. class, with 10 and 11 starters respectively, there remains a fleet of 39 yachts divided among 16 classes, or an average of less than 3 yachts to a class. One contributory cause of this is the multiplication of special classes, such as the special 21ft., special "34-rating," special 30ft., etc.

It is not easy to suggest a practicable remedy capable of immediate application, but there is one line of action which, if consistently followed by all clubs, will help matters very much. This is the direct encouragement of a smaller number of regular classes and, so far as possible, the discouragement of intermediate classes and of yachts not built to any class.

The special class has probably had its day and served its purpose; we hope that before many seasons some amendment of the measurement rule will be possible which will place further restrictions on the building of machines and encourage a more usable type of yacht in all classes, thus obviating the necessity for the special restrictions outside the rule itself. A movement in this direction is now under way in the rule adopted last year in Great Britain. Should such a change of the measurement rule be put into effect as would increase the accommodation and decrease the draft, then the next step would be to select a certain range of classes fewer in number than at present, to which men might build under the new rule. All the legitimate demands of yacht racing might be met by classes as follows: Schooners, 95ft. upper limit; 75ft. upper limit; cutters, sloops, yawls and cat-boats; upper limits of classes, 70ft., 51ft., 36ft., 30ft., 25ft., 20ft. and 15ft. The classes from 30ft. down would be doubly sub-divided, first as to rig, sloop or cat; and second as to open or cabin boats. This would reduce the total number of classes necessary from 30 to about 17. With regular building to these classes from year to year, the racing would be far better than as at present, where competition in any one class is often limited to two or three yachts. In England, where yacht racing as a system has attained a far higher degree of perfection than in this country, comparatively few classes have proved necessary; the 60-rating, 40-rating, 20-rating, 10-rating, 5-rating, 2½-rating, 1-rating, and 0.5-rating.

It would be an excellent thing in every way if the present system of measurement and classification in this country could be remodeled by a change of the form of the rule and the introduction of an entirely new term to denote the unit of measurement, something like "rating," "ton," "racing length," etc., but more exact and definite. With such a unit, and starting with the smallest regular class, the 15ft. as measuring 1, the 20ft. for instance as 2, the 25ft. as 5, etc., the existing complexity and confusion, the use of numerals and high numbers absolutely meaningless in themselves to indicate the size of the class, would all disappear and a yacht would be definitely described by the one term similar to 1-rater, 5-rater, etc.

THE annual regatta of the Seawanhaka C. Y. C. will be sailed on Saturday, June 27, over the regular club courses off Oyster Bay. The race will be sailed under the rules of the Y. R. U., and prizes will be given in all of the classes, regular and special. Full details as to courses, entry, etc., may be had of the secretary of the race committee, Chas. A. Sherman, 67 Leonard street, New York.

Seawanhaka C. Y. C. Trial Races.

OYSTER BAY—JUNE 22, 23, 24.

ONE extreme of international racing was witnessed last year in the building of a single craft, at enormous expense, with the practical certainty that, good or bad, she was to be the defender. This year the other extreme has been reached in the construction of a fleet that is of unknown numbers, all types being represented, and from some thirty or forty of which the defending boat will be selected after a series of trial races. Certainly such a unique fleet as that seen this week at Oyster Bay has never been brought together in the annals of yachting; so many craft of one measurement, but differing in every detail of design, construction and rig. The programme of the races and chart of the courses were published last week. The yachts, as officially entered, are as follows:

Manowtasquok.....	Regis S. Post.....	Great South Bay.
Florence.....	E. Cohen.....	Tappan Zee.
In It.....	F. M. Randall.....	Atlantic.
Kittie V.....	Hazen Morse.....	Huguenot.
Ideal.....	H. O. Havemeyer, Jr.....	Seawanhaka.
Die Hexe.....	S. C. Blaisdell.....	Knickerbocker.
Two Step.....	W. H. Jennings.....	Indian Harbor.
Glance.....	F. L. Downing.....	Harlem.
Maudeen.....	R. B. McManus.....	Am. Canoe.
Ulme.....	W. W. Howard.....	Tappan Zee.
*Isabel.....	J. P. McQuade.....	Seawanhaka.
Gnome.....	F. M. Hoyt.....	N. Y. Canoe.
Julie.....	J. Brown.....	Douglaston.
Willada.....	W. G. Newman.....	Stamford.
Saghaya.....	Howard C. Smith.....	Seawanhaka.
Paprika.....	C. Sherman Hoyt.....	Huguenot.
Question.....	L. T. Huntington, Jr.....	Fall River.
Columbia.....	F. T. Wood.....	N. Y. Canoe.
Terrapin.....	W. S. Peters.....	N. Y. Canoe.
Tornado.....	F. C. Morris.....	N. Y. Canoe.
El Heirie.....	C. H. Crane.....	Seawanhaka.
Defender.....	W. G. Brokaw.....	Larchmont.
Nike.....	F. W. Meeker.....	Seawanhaka.
Trilby.....	G. G. Tyson.....	Indian Harbor.
Sola.....	C. T. Willis.....	Indian Harbor.
Nit.....	W. W. Murray.....	Conanicut.
Hope.....	Arthur Iselin.....	Huguenot.
Riverside.....	Riverside Syndicate.....	Riverside.

* Now Defender II., W. G. Brokaw, Larchmont Y. C.

One looks in vain through the list for the name of the successful defender of the Seawanhaka international challenge cup last season, when it was first raced for, Ethelwynn, the winner of the three trial races and of three out of the five cup races. Late last season the yacht was sold to the Leonard Brothers, two young yachtsmen, who proposed to make certain necessary changes and to race her in the class this season. She was sailed down from Greenwich to South Brooklyn, and stored in one of the warehouses of Manning's Basin. There she still lies, dusty and neglected. One of her new owners is abroad, the other is in the West, and no effort has been made to race her. There is good reason to believe that with a new centerboard and rudder, and larger sails, all of which were defective last year owing to the late date at which she was begun, and sailed by the Bail Brothers, who won the last two of the international races, she would still be a dangerous boat. The model will be represented in the trial races by two similar boats of Mr. Stephens's design: one, Two Step, built from the same mould and fitted with the same sail plan; the boat shown by the Spalding-St. Lawrence Co. at the Sportsman's Exhibition. Though out very early in the season, the boat has been kept at her owner's home, Southport, Conn., and has had few opportunities for trial with others of the class. She has come up the Sound on three different occasions to meet the fleet and has been defeated each time. Since the last race her owner has replaced the original Scarecrow rig with the boom and gaff. The other new boat is of similar model, but a couple of inches wider, with a little less draft and waterline and proportionately more sail. She too was built by the Spalding-St. Lawrence Co., and the pair are among the handsomest of the fleet, both in graceful form and in construction and finish. Ideal has the same rig as the others, the leg o' mutton. She was only launched on June 11, and though she has sailed in two races there has been no time for careful tuning up; in fact, in the trial races she will be handled by a helmsman who has never yet seen her.

Of the old boats of 1895, Question and Trilby are both entered, the former unchanged from last year. Trilby has a new rig and some minor changes. Another old boat, the Herreshoff Olita, has been materially altered this season and sailed in the races of the class, but with poor results, in spite of the skill of her helmsman, L. B. Huntington, Jr., the winner of the helmsman's prize in the trial races last year. She was not started at Larchmont on Saturday and will not enter the trial races, but Mr. Huntington will sail Paprika, with her owner, Sherman Hoyt, as crew.

The latter boat has shown remarkable speed in a fresh breeze, as in the Knickerbocker and Douglaston regattas, and so far is the most promising of the fleet, she having been out for some time and winning three out of the five races in which she has started. She, with her sister boats, Hope and Willada, have already been described. She is unlike them in having a round bilge and side, with a distinct tumble home at the deck.

The new boat Ulme will appear in the trial races under the name of Defender II., given to her by W. G. Brokaw, who last week purchased her from W. W. Howard. Mr. Brokaw has the promise from Mr. Iselin of the loan of the Yellow Dog by way of mascot, provided that the consent of the race committee can be obtained. In the Larchmont race of Saturday, Defender II., without the canine appendage, was sailed by two strangers who failed to get her to windward—a difficult enough matter for her owner, who was very expert in her. In the races she sailed thus far both helmsman and crew have used toe straps to hold the feet when hiking out, a proceeding essential to the keeping of her mast up and keel down. Her centerboard is of aluminum. Wilson & Griffin will make her a new mainsail with a reasonable amount of peak.

In some cases it may be difficult to draw the line between the so-called "honest boat" and the freak. In this purely racing class there is no assumption that the yachts are to serve as models for larger craft, that they are to make homes for their owners, or that they are anything but racing toys. At the same time there is a wide distinction between such little ships as the Herreshoff bulb-fin Trust Me and the Sibbick bulb-fin Microbe on the one hand, and some of the yachts and packing cases that the class has produced. Some of the yachts, like the two bulb-fins, are little ships in which a man can at least sit, stand and move about, eat his meals, shift his togs, and enjoy a certain change of position. Others of the class, however, are for one cause or another fitted for nothing more than a short race or sail, the crew lie flat on deck in cramped and uncomfortable positions, or even if the yacht boasts a well, her peculiarities of model are such that she cannot be sailed along easily and comfortably, but must be watched all the time, and handled with exceptional care to prevent a capsize.

Whatever question may exist as to where to draw the line between the two classes, there are two boats that are most certainly on the wrong side, being freaks in all that the name implies to the nautical mind. These two, In It and Kittie V., are designed on the same principle, or lack of principle, to be more accurate. The controlling idea, as stated before in describing the former, is to have a sort of double hull, the lower one to be measured and the upper one to do the sailing on. Just how this is to be accomplished we cannot clearly understand, the changes being, as it seems to us, that the proposed rule cheater must either be too small or too large in the underwater body. From the first view of the pair in the Larchmont regatta, with smooth water and a very light breeze, it would seem that one has failed on one side and the other on the reverse.

In It is owned by F. M. Randall and sailed by T. F. Day, being designed and built by the Crosby Co., of which Mr. Randall is secretary. She has been hastily put together; the frames steamed and bent into place, those at the ends being canted, to save beveling; the planking is white pine in a single thickness, with no attempt at tight seams, a covering of canvas being stretched over it to make it tight. There are no bulkheads, but the boat is open from end to end below, with a large well—a bad arrangement in rough weather. The rig is light in the extreme, with small, solid mast and boom and a trusted gaff of light strips. The rudder is of the balanced type and the centerboard is of wood. The name is contrived to meet all possible contingencies at small expense; it is now IN IT; in the event of her being chosen to defend the cup, she will sail as the WIN IT; and in the not impossible contingency of a complete failure she will go into history as the "N IT."

Kittie V., as her name indicates, is the successor to Kittie IV., the fast catboat of the last two seasons, now sold to go to Galveston. She was designed and built by Thos. Webber for Hazen Morse, owner of the former Kitties. In appearance she is strongly suggestive of a raft built of clapboards as a last resort in a freshet; she is long and wide and carries her breadth from end to end; the sides are very low, she is built of white pine, the bottom lapstrake and the decks flush laid, and as she is innocent of paint or varnish, with no finish to the natural wood, the effect is not unlike a pile of common pine clapboards afloat. From all reports the keel contour is similar to that of In It, but as sailed at Larchmont she was evidently badly by the head, so that she had little freeboard forward and nearly all of her fore overhang was immersed. Like the other, she has a rig more appropriate to 19ft. waterline than 15, but hastily fitted and rough; in spite of a long bowsprit, she is practically cat-rigged, with a very large mainsail and small jib. She is an ordinary wooden board, very long and weighted with lead.

So far as can be judged on the showing in their first race, while in the Randall craft the under boat is too large, in the Webber boat it is too small. In It, with but the lightest of breezes, floated high, showing indeed a short waterline, but staggering around as though the short lower boat were tired, and refused to carry the big upper boat. With a little wind she lopped down on her side, but still failed to show an immersed line of phenomenal length, and she certainly can never sail fast in such a position. In Kittie V., on the other hand, the lower boat was evidently too small—in fact, refused to carry the upper one even for the brief period necessary to hoodwink the eyes of the official measurer—and to the eye showed very little fore overhang, coupled with but a moderate amount aft; and a correspondingly long waterline that would throw her out of the class unless her sail area were reduced to a fraction of its present dimensions. She did, it is true, obtain the great length when sailing that is one of the two points claimed for the class, and with it and her large sail plan she reached very fast; but she is plainly a very great way from fulfilling the other essential condition of measuring into the class. There will probably be fun should a good puff strike this happy pair in any of the races. The fun will be limited to the spectators, and not distributed among the thirty other members of the fleet whose safety is threatened by the sharp bowsprits that are running about wildly with no control from the rudders.

While the Larchmont race was by no means a conclusive test of the fastest boat, or even of the probable winner in a series of weekly races about the Sound, such as those already sailed by the class, the conditions were very close to those too frequently met on the other shore of the Sound, as in all the trial races of last year—smooth water, light winds and flat calms. Under these circumstances the success of the Boston boat, El Heirie, makes her a very dangerous competitor. She is the work of an amateur designer, D. H. Crane, and the hull, built by Lawley, is a very neat piece of work, with mahogany planking and white pine deck. In general type she may be classed with Ethelwynn, having about the same over all and waterline length, 23ft. 3in. and 14ft. 4in., a straighter side, with less flare, the beam being but 5ft. 6in. instead of 6ft. extreme and 5ft. at the waterline, the draft of hull being about 5in. and with board down 5ft. The centerboard is of ¼in. plate, of the Linton Hope pattern. The sheer is quite straight and the fore overhang is longer and the after shorter than in Ethelwynn, the general appearance from abeam being more like the Dyer boats. The rig has a boom and gaff mainmast well peaked. The boat made a well-judged start; keeping to leeward of the pack and entirely clear of all blanketing, she moved off very fast in the light wind and continued to gain all day. As seen afloat, she is a moderate boat, well proportioned and with no freak features, and should be good in a sea and breeze as well as in light weather.

MONDAY, JUNE 23—FIRST TRIAL RACE.

On Saturday and Sunday 15-footers of all types were coming into Oyster Bay, and by Monday morning a motley fleet was assembled off the club station. While the number was not as large as anticipated—only twenty-six yachts actually starting, with several more about the harbor—the fleet was a unique and interesting one. The morning was clear and bright, with a light west wind and a smooth sea. The fleet was off the Center Island Buoy at noon, the start being given exactly at 12:30. The triangular course was sailed, the easterly leg first. The starters are as in the final table. Ideal was steered by H. B. Duryea, with W. I. Zeregasas crew; Riverside, by her designer, Chas. Oumstead; El Heirie, by Messrs. Crane; Two Step, by Herbert Jennings; Hope was steered by Mr. Howard, with L. B. Huntington as crew; Trilby was steered by F. B. Jones; Paprika, by L. D. Huntington, Jr., with her owner, Sherman Hoyt, as crew; Vesper, by Paul Butler, with Butler Ames; Gnome, by F. M. Hoyt and F. Whiting; Kittie V., by Hazen Morse; Die Hexe, by Mr. Wyckoff; Yola had Thomas Clapham as crew; Columbia was steered by her designer, F. T. Wood; In It, by T. F. Day; Tornado, by F. C. Moore and H. H. Smythe, and Defender II., by Al. Camacho.

Apart from one or two unimportant fouls, the fleet made a good start from the gun at 12:30. Mr. Duryea had Ideal over first, with Terrapin close to her. El Heirie made a very good start, and Riverside, Two Step, Paprika and Hope were among the first; beyond this it was impossible to keep track. With spinnakers to port they ran off slowly, Two Step taking the lead, the first four being Two Step, Gnome, Nit and Ideal. Gnome had her boom on the wrong side and was obliged to gybe. The first mark was not on its proper bearings, but further off shore, upsetting the calculations of some. As the times at the first mark show, the fleet ran very evenly down wind. Manowtasquok, sailed by her owner alone, with no crew, very soon dropped out. The leaders at the mark were Gnome, Riverside, Ideal, Two Step, Kittie, Nit. Barely 5 minutes separated the first and last.

After luffing around the mark the leaders trimmed for what proved to be but an easy reach; but Paprika, Vesper and several others at once went on starboard tack, sailing far out of their course. El Heirie took the lead within the first mile, the order then being, after her: Riverside and Gnome in close company, Hope, Kittie, Ideal, Two Step, Trilby, Die Hexe, Defender II., etc.

A few minutes on the wind put Gnome out of the fight. Ideal soon went up to third place, and the big fleet began to scatter. El Heirie held the lead for some time, but near the end Riverside passed her to windward and weathered the buoy, the other having to tack for it. Ideal came along in second place. Hope had done very well off the wind, but was now down to leeward with Gnome. Trilby was doing very good work and turned in fourth place. Two Step was hand-

capped by a new rig, a boom and gaff mainsail, and a larger jib with a club on the foot, in place of her original Ethelwynn rig, and got no better than fifth place. Only the leaders were timed in the table.

1] Riverside was slow with her spinnaker, while Ideal's was smartly handled, as was El Heirie's. Down wind Riverside made a gain on Ideal, and Two Step passed Trilby, the order at the end of the first round being: Riverside, Ideal, El Heirie, Two Step, Trilby.

The wind was now north of west, making a beat on the second leg instead of the usual reach, which was much to Ideal's liking. She closed up the space between her and Riverside, and after a mile was on the latter's weather beam, which finished the race so far as first place was concerned. In the beat of 2 miles she made 2m. 14s. on Riverside. The final leg was now a free reach, in which Riverside picked up a few seconds, the order at the finish being: Ideal, Riverside, El Heirie, Two Step, Hope, Trilby, Paprika, etc., as in the last column of the table. Mr. Duryea sailed Ideal under a serious handicap, as he had never seen the yacht before boarding her just prior to the start. While the weather was very light and more wind is hoped for in the other races, it was the average summer weather, in which most of the races, as last year, will probably be sailed. The new Butler boat, Vesper, was at a great disadvantage, having never been floated until she reached Norwalk the day before.

The boats were timed as follows:

Riverside.....	4 07 06	Die Hexe.....	4 37 36
El Heirie.....	4 11 21	Yola.....	4 38 03
Two Step.....	4 22 19	Columbia.....	4 38 14
Hope.....	4 25 41	In It.....	4 38 41
Trilby.....	4 29 48	Saghaya.....	4 40 20
Paprika.....	4 30 12	Cyclone.....	4 40 54
Vesper.....	4 30 43	Willada.....	4 43 13
Gnome.....	4 34 43	Tornado.....	4 46 50
Kittie V.....	4 36 32		

SUMMARY.

	Start.	Finish.
Ideal.....	12 30 00	4 05 00
Riverside.....	12 30 00	4 07 06
El Heirie.....	12 30 00	4 11 21
Two Step.....	12 30 00	4 22 19
Hope.....	12 30 00	4 25 41
Trilby.....	12 30 00	4 29 48
Paprika.....	12 30 00	4 30 12
Vesper.....	12 30 00	4 30 43
Gnome.....	12 30 00	4 34 43
Kittie V.....	12 30 00	4 36 32
Die Hexe.....	12 30 00	4 37 36
Yola.....	12 30 00	4 38 03
Columbia.....	12 30 00	4 38 14
In It.....	12 30 00	4 38 41
Saghaya.....	12 30 00	4 40 20
Cyclone.....	12 30 00	4 40 54
Willada.....	12 30 00	4 43 13
Tornado.....	12 30 00	4 46 50

The following did not finish: Maudeen, Isabel, Glance, Manowtasquok, Terrapin, Nike, Question, Defender II., and Nit.

New Hanley Yachts.

From the Boston Globe.

THE boat which Hanley has been building in his shop at Monument Neck is no longer a "dark secret," and the design which for the past few months has excited the curiosity of yachtsmen has been given out by Mr. Hanley.

The boat measures 32ft. over all and 23ft. on the waterline, but the most remarkable feature is that she only draws 10in. of water. She combines the racing qualities of the old square stern boats with the modern overhanging bow and it is predicted that she will show remarkable speed.

The boat is fitted with a bronze centerboard, and will have cross-cut sails with a spread of about 1,000yds. She is also fitted with cabin furnishings, so that she may come under the requirements of the Larchmont Y. C. rules. She has two rigs, either cat or sloop, as desirable.

The cockpit is roomy, while the cabin is large enough for a half dozen persons to live in it with comfort.

The new boat has been named Volsung, and was built for the De Forest Brothers, of New York. She will sail in the second class and her maiden race will be on June 17, in the Beverly Y. C. regatta, off Wing's Neck.

In the same class will sail Bernice, Surprise, Linnotte and others of last year's racing fleet, and the contest in this class will be certainly interesting.

From here Volsung will go on to New York in season to enter the races of the Larchmont Y. C., and from there she will be sailed to Bar Harbor, and when the racing season is in full blast will be sailed to New York, entering all the regattas between Bar Harbor and her destination.

The new boat will be given several trial spins in addition to those which have already taken place, and Hanley feels confident that she will make a new record on the occasion of her maiden race.

Hanley is building a boat of the 17ft. class for himself, which will be finished in time for some of the races.

The new boat for the Parkinson boys, which Hanley built, has proven in the trial spins to be a very fast sailer, and the new boats from across the bay, which have been built for Winship and Whittemore Brothers, will meet a dangerous rival in the 15ft. class or half-raters.

The big Eustis boat is now in racing trim, and will be on hand to compete with Ashumet for honors in the 34ft. class.

Little Peter, which made such an enviable record last year, will also be entered in the opening race.

Important, if True.

THERE is a possibility that Chicago may furnish the yacht to defend the America cup. Growing out of a jocular remark made by Theodore Poekel is a plan for the construction by Chicago men of a yacht to sail in the New York trial races as a candidate for the defense of the trophy won by America.

Two or three weeks ago a party of Chicago yachtsmen was in the works of the Racine Boat Manufacturing Company, watching with critical eyes the progress of E. C. Berriman's yacht Vencedor. It was about the time of the announcement that Emperor William would send Meteor to sail for the America cup. One of the party was Theodore Poekel, designer of Vencedor and formerly for the Herreshoffs of Defender.

"I can build a yacht that will beat Defender," said Theodore Poekel. "If you can do that," replied one of the men of the party, "I will furnish the money to build it."

"You will not furnish it at all," said another of the Chicago yachtsmen, "for I want to do that part myself."

It was then agreed between two of the party that in the event of a challenge by the Emperor or by any other yachtsman for the America cup they would bring out of the Racine yards a yacht to sail in the preliminary heats under the auspices of the New York Y. C.

The offer of the Chicago men was made in good faith, and they have gone as far in the matter as is possible until a challenge for the America cup has been received by the New York Y. C. After the receipt of the challenge, nine months must elapse before the preliminary races, giving ample opportunity for the construction of an adequate boat. A race for the cup will not be possible then till the spring of 1897. It will be necessary for one or more of the owners of the Chicago boat to become members of the New York Y. C. Several Chicago men are already enrolled in its membership.

The men who are back of the proposition prefer to remain in obscurity for the present at least, till their mettle is tested by a challenge for the cup. Their offer is said not to be conditional on a challenge by Emperor William, but to be open in the case of a challenge by any other reputable owner.

The mere possibility of the construction of a yacht on fresh water for the defense of the cup is sufficient to cause a stir among yachting men, the designing of fast boats having been confined to the seaboard. According to E. C. Berriman, there is nothing improbable in the idea of the construction of a winner on a fresh-water shipyard. The conditions of sailing are somewhat different, but there is no reason why a cup defender should not be built on Lake Michigan.—Chicago Tribune.

A Stray Shinplaster

Comes to us once in a while for a copy of "Game Laws in Brief;" but shinplasters nowadays are scarcer than Moose in New York; and 25 cents in postage stamps will do just as well.

Atlantic Y. C. Annual Regatta.
BAY RIDGE—NEW YORK HARBOR.
Tuesday, June 16.

THE Atlantic Y. C. was particularly fortunate this year in having a good breeze for its annual regatta, with a fleet sufficiently large to make the racing interesting in the different classes. The regatta was open to the yachts of the other leading clubs; the prizes were:

The Gould Cups.—Two special cups offered by Com. George J. Gould, valued at \$1,000 and \$500, one for schooners and one for cutters or sloops. The prizes to become the property of the owners of the winning yachts. Separate entries were required for this event. All schooners raced in one class and all cutters and sloops in one class, each yacht being entitled to time allowance according to her actual racing length. No second prizes to be awarded, nor the cups to be awarded in case of a walk over.

The club offered the following prizes to the winners in each class in which two or more yachts start with the bona fide intention of going over the course. If but one yacht starts in any class, such yacht, after having gone over the course as prescribed, will receive a walk-over prize of one-half the value stated in the schedule. Also, if five or more yachts start in one class, a second prize of one-half the value of the first prize will be given to the yacht second at the finish by corrected time.

Schooners.—Class 1, \$150; class 2, \$125; class 3, \$100; class 4, \$75; class 5, \$50.

Cutters and Sloops.—Class 1, \$100; class 2, \$75; class 3, \$65; class 4, \$60; class 5, \$55; class 6, \$50; class 7, \$50; class 8, \$40; class 9, \$35; class 10, \$30; special 30ft. class of 1896, \$40.

Cats.—Class 1, \$25; class 2, \$25; class 3, \$25.

This year a new starting and finishing line has been laid down, marked by two stakeboats at the mouth of Gravesend Bay, on a line between Fort Lafayette and Norton's Point. From this line the various courses were:

Course 1.—For all schooners competing for the Gould cup, and for all schooners and Classes 1, 2 and 3 of cutters entered for the annual regatta and not for the Gould cup: From the starting line to the Southwest Spit Buoy Nos. 12 and 10, leaving them on the port hand; thence to the bell buoy off the point of the Hook, leaving same on starboard hand; thence to the Scotland Lightship, leaving same on the port hand; thence to and around the Sandy Hook Lightship, leaving same on the port hand; thence to the bell buoy off the point of the Hook, leaving same on the port hand; thence to the Southwest Spit Buoy Nos. 10 and 12, leaving both on the starboard hand; thence to the finishing line, keeping to the southward and westward of the beacon on Romer Shoal, and to the eastward of buoy No. C9, on west bank, both going and returning. Distance, 33 miles.

Course 2.—For all cutters competing for the Gould cup, and cutters of Class 4 entered in the annual regatta and not for the Gould cup: From said starting line to Southwest Spit Buoy Nos. 12 and 10, leaving same on the port hand; thence to the bell buoy off the point of the Hook, leaving same on the starboard hand; thence to and around the Scotland Lightship, leaving same on the port hand; thence to bell buoy off the point of the Hook, leaving same on the port hand; thence to Southwest Spit Buoy Nos. 10 and 12, leaving both on the starboard hand; thence to the finishing line, keeping to the southward and westward of the beacon on Romer Shoal, and to the eastward of buoy No. C9, on west bank, both going and returning. Distance, 2½ miles.

Course 3.—For cutters and sloops of Classes 5, 6 and 7, and the special 30ft. class of 1896: From said starting line to a stakeboat anchored near Buoy No. 6, off the northern point of Sandy Hook, leaving same on the port hand; thence to and around the Scotland Lightship, leaving same on the port hand; thence to the finishing line, keeping to the southward and westward of the beacon on Romer Shoal, to the northward and eastward of the bell buoy off the point of the Hook, and to the eastward of Buoy No. C9, on west bank, both going and returning. Distance, 2½ miles.

Course 4.—For all other classes: From said starting line to Southwest Spit Buoy Nos. 12 and 10, leaving both on the port hand; thence around a stakeboat anchored near Buoy No. 6, off the northern point of Sandy Hook, leaving same on the port hand; thence to the finishing line, keeping to the southward and westward of beacon on Romer Shoal and to the eastward of Buoy No. C9, on west bank, both going and returning. Distance, 1½ miles.

The entries included forty-five yachts in all, but only thirty came to the line, as follows:

SCHOONERS—GOULD CUP.		Measurement.
Colonia, C. E. Postley	Not meas.
Emerald, J. R. Maxwell	90.47
Amorita, W. G. Brink	74.82
Elsemarie, J. B. King	74.67
SLOOPS—GOULD CUP.		
Wasp, H. S. Lippitt	54.97
Acushla, W. & A. Hannan	33.35
Hera, R. N. Ellis	30.00
SCHOONERS—CLASS 2.		
Sachem, F. T. Adams	82.28
Iroquois, H. C. Rouse	54.99
CUTTERS AND SLOOPS—CLASS 4.		
Penguin, G. E. Brighton	49.20
Choctaw, J. M. Strong	46.20
Uvira, E. M. Lockwood	42.75
CUTTERS AND SLOOPS—CLASS 6.		
Eidolon, C. E. Diefenthaler	41.64
Norota, F. M. Hoyt	39.00
Ilakato, E. H. Converse	35.60
CUTTERS AND SLOOPS—CLASS 7.		
Aliris, J. A. Constant	24.11
Feydeh, E. D. Cowman	23.02
CUTTERS AND SLOOPS—CLASS 9.		
Adele, A. J. Harrison	28.30
Grace E., W. E. Neidhardt	27.20
CATS—CLASS 1.		
Step Lively, F. M. Randall	27.20
Squaw, H. S. Jewell	27.20
Dorothy, F. M. Wilson	27.20
CATS—CLASS 2.		
Streak, H. C. Lary	27.20
30-FOOTERS—SPECIAL.		
Wawa, James Stillman	27.20
Vaquero III, H. B. Duryea	27.20
Caroline, Pembroke Jones	27.20
Esperanza, A. S. Van Winkle	27.20
Asaki, Bayard Thayer	27.20
Musme, J. M. McDonough	27.20

The morning was cloudy and cool, with very little wind and a poor promise of more, while there was a thick haze to seaward. The wind, such as it was, came from S.E., making a beat of a couple of miles from the station off Bay Ridge to the starting line, while the last of the flood tide was rushing through the Narrows against the yachts as they worked slowly down. The start was set for 10:30, but there was a general delay among the fleet, and at that hour the last yachts had hardly left their mooring. The steam yacht Atalanta, Com. Gould, was in attendance, while the big steamboat Gen. Slocum carried the members of the club. The fleet was arranged to start in five divisions with ten-minute intervals between, thus covering a period of forty-two minutes from the preparatory to the start of the last class, the 30-footers. As there were only two, three or four boats in a class, except the latter, it would have been perfectly practicable to have sent each class away with a one-gun start at five-minute intervals, putting some life and action into what turned out a particularly dull and dreary start.

Owing to the delay of the racing men it was not until 11:30 that the preparatory signal was given from the regatta committee's tug, followed five minutes later by the starting signal for the schooners for the Gould cup. Colonia, Emerald, Amorita and Elsemarie had been working about in Gravesend Bay for some time under working topsails, as clubtopsails were barred in all classes. The breeze had strengthened some time before and there was quite enough to promise an exciting race. Colonia was timed for a good start and crossed the line 35 seconds after the gun; the others came along in a string at intervals of a minute, making a pretty sight for the ladies, but robbing the start of that interest which racing men appreciate. The four crossed on port tack and trimmed hard down for a close reach to the Spit Buoy, Colonia leading. From the start she slid off after the fashion of her first season, her centerboard having been jammed a few days before; though she was on the railway on Monday, the damage could not be remedied.

When the start for the cutters racing for the Gould cup was given, 10 minutes later, there were no signs of any proposed starters, not one of the many yachts in the Bay approaching the line. Just before the handicapped gun for the class fired, 5 minutes later, the little 30-footer Hera crossed the line, and a little later Wasp and Acushla, both handicapped, followed her. By and by Sachem and Iroquois crossed, and at the end of half an hour just nine yachts started.

By the time that the thirties had been sent away to a single gun, the six of them making a fine sight as they fought for place, the leaders were out of sight near the S. W. Spit. Emerald had worked well out to windward of Colonia, holding on far better, and now took the lead. Amorita was safely ahead of Elsemarie, and with an allowance of about 15m. was a constant menace to the leaders. In the same way Hera, with nearly 45m. allowance from Wasp, was making it very in-

teresting for that renowned racer, holding the lead for a long time after the start. Acushla, also with a big allowance, soon dropped astern of Wasp, and at no time was dangerous.

The large craft luffed around the Spit Buoy and reached out for the point of the Hook, where the windward work proper began. Owing to the very late start of the club steamer and the committee boat from the line, the head of the race was lost to sight for a long time, only being picked up off the point of the Hook, with the Emerald in the lead by half a mile.

At the end of the short beat to the Scotland the four big schooners were timed:

Emerald	1 26 00	Amorita	1 31 05
Colonia	1 27 40	Elsemarie	1 35 30

They set jibtopsails for the reach across to the Sandy Hook Lightship, where the times were:

Emerald	1 48 35	Amorita	1 54 58
Colonia	1 50 50	Elsemarie	1 58 53

After the jibe they started for the long reach in to the Spit with a good breeze to help them.

The order of the other yachts at the Scotland was Wasp, Uvira, Hera, Iroquois, Choctaw, Penguin, Norota, Eidolon, Sachem and Acushla. Uvira had very handsomely outsailed both Choctaw and Penguin.

The larger yachts were timed at the jibe at the Spit:

Emerald	2 41 45	Amorita	2 52 35
Colonia	2 43 50	Elsemarie	2 57 36

From here in they were able to set spinakers to starboard, the smaller yachts, bound up the Swash, also setting spinakers. The finish between Emerald and Colonia was stirring, though it was a foregone conclusion that the former had won over the latter. The position of Amorita, 15m. astern, was a matter of doubt. As a matter of fact she came within 1m. 9s. of winning the Gould cup from Emerald; but the two were so far apart in actual time that the finish was not interesting. The same was true of most of the other classes, the exceptions being the very close finishes between Norota and Eidolon, Adele and Grace E., and between the first three of the 30-footers. Two noteworthy features of the race were the very bad defeat of the fast 34-footer Acushla, a centerboard boat, by the new bulb-fin 30-footer Hera, of the same length; and the fine cutter Uvira's victory of 7m. over the two centerboard boats Penguin and Choctaw.

The official times were:

SCHOONERS—FOR GOULD CUP.				
	Start.	Finish.	Elapsed.	Corrected.
Emerald	11 36 46	3 22 07	3 45 21
Colonia	11 35 32	3 24 53	3 49 01
Amorita	11 38 06	3 37 03	3 58 57
Elsemarie	11 38 06	3 49 01	4 11 37
CUTTERS AND SLOOPS—FOR GOULD CUP.				
Hera	11 45 35	3 48 24	4 02 49

Wawa	12 12 00	3 06 11	2 54 11
Esperanza	12 12 00	3 06 26	2 54 26
Caroline	12 12 00	3 10 38	2 58 38

The winners were: Gould cup, schooners, Emerald; Gould cup, cutters and sloops, Hera; schooners, 95ft. class, Iroquois; \$125; cutters and sloops, 60ft. class, Eclipse, \$37.50; 51ft. class, Uvira, \$55; 43ft. class, Norota, \$50; 36ft. class, Feydeh, \$50; 25ft. class, Grace E., \$40; 30ft. special class, Asahi first, \$40; Musme second, \$20; catboats, class 1, Step Lively, \$25; class 2, Streak, \$12.50.

The race was managed by the regatta committee: Messrs. John L. Bliss, Chairman; Henry J. Gielow, David E. Austen, George W. McNulty and W. L. Gerrish.

A New Chicago Yacht.

THE big sloop Siren, first of the fin-keeled racers built at Racine for Chicago yachtsmen, arrived from Racine on June 14 and anchored in the basin at the foot of Randolph street. She was immediately boarded by about 100 yachtsmen, and as each craft came in from the lake and picked up her moorings the crew hurried aboard the new craft to inspect her. With three or four of the smaller yachts tied up alongside and a half dozen dinghies and row boats trailing astern, the big racer looked much like a large hen with a flock of chickens, and a good view of her hull was next to impossible to obtain.

The initial sail of Siren was a disappointment, inasmuch as at no time was there enough wind to give her owners and crew an indication of what she could do and what canvas she could carry. Capt. Ramsdell said last night that he thought she would need a longer gaff, however. Siren left Racine about 10 o'clock Saturday evening. On board were George A. Gardner, Com. Sollitt, Fox Lake Y. C.; Frank B. Newall, M. W. Berriman, Robert Hayes, C. W. Boyden and Douglas Dyrnforth. The wind showed so little promise that Siren was towed back into Racine again, and several hours later she made another start. Although the whole voyage was a beat against a light southeast wind, the crew kept at it and planned to run in at Kenosha and wait for better weather. But when Kenosha was reached the wind rose again and they continued on to Chicago.

Siren has been fitted out hurriedly, but by Saturday, when she will start in the Michigan City regatta of the Columbia Y. C., she will be in pretty good trim, although it will take pretty lively work on the part of Skipper Henry Goble and his crew.

Siren is a decided novelty among the older yachts in the anchorage. She has a very low lead and wide spaces of deck. Her cockpit is commodious, and she steers with a long wooden tiller. Capt. Ramsdell says when by the wind she steers herself. Her mast is stepped well forward, and in reality she is a big catboat, with enough headsail to do away with the weather helm a catboat always carries by the wind. The forestaysail sets on a stay, but the jib is set flying on its own luff. The bowsprit is shorter than an 18-footer carries, and the spars are not lofty for a boat of her length over all. The topmast especially is short. In the mainsail the very high peak is noticeably absent, but the sail is large and presents a good driving power. The dimensions of the spars are:

Main boom 47ft., gaff 25ft., hoist 29ft., length of lowermast 45ft. 6in., length of topmast 26ft., bowsprit outboard 10ft. The dimensions of the hull are: Over all 60ft., load waterline 41ft., beam 12ft. 6in.

There is a trunk over the main cabin, which has four berths, but the two staterooms, gallery, forepeak, etc., are below the flush deck. While from the standpoint of an artist it cannot be said that Siren is pretty, yet she has the beauty of a racing horse and she looks as if she could sail, and Saturday's race will tell the story. The hull is painted white, with the oak sheer strake and rail scraped and varnished. The trunk cabin and skylight are mahogany, and the interior of the cabin is in hardwood.

Siren will be the flagship of the Columbia Y. C. this season, Com. Boyce being interested in her.

William Hindshaw, Jr., who is superintending the construction of the new fin-keeled racer for William Crawford, of the Columbia Y. C., yesterday announced that the name of this yacht will be Vanenna. This being translated is said to mean "sure footed," and it is certain if one of the fin-keels ever goes ashore she will get a very solid footing on the bottom. Vanenna should have been launched early this morning and will certainly be ready for the Michigan City regatta Saturday. The first race between these two exponents of new yacht building ideas will be attended with much interest on the part of every amateur sailor in Chicago. It is thought exceedingly unfortunate that Vencedor will not be out to take part in this contest.—Chicago Record.

The FOREST AND STREAM is put to press each week on Tuesday Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Brooklyn Y. C. Annual Regatta.
BATH BEACH—NEW YORK BAY.
Monday, June 15.

THE annual regatta of the Brooklyn Y. C. was sailed on Monday last over the club courses on New York Bay, as follows:

OPEN BOATS.

Mainsail—Class A, 21ft. racing length and under.—To black buoy No. 9, to red bell buoy head of Swash Channel and return to starting line; 10 miles.

Class B, over 21ft. to 25ft. racing length.—To black buoy No. 9, to red bell buoy head of Swash Channel and return to starting line; 10 miles.

Class C, over 25ft. to 30ft. racing length.—To Old Orchard Shoal Light, to red bell buoy head of Swash Channel and return to starting line; 15 miles.

Jib and mainsail—Class 1, 25ft. racing length and under.—To black buoy No. 9, to red bell buoy head of Swash Channel and return to starting line; 10 miles.

Class 2, over 25ft. racing length.—To Old Orchard Shoal Light, to red bell buoy head of Swash Channel and return to starting line; 15 miles.

CARIN YACHTS.

Mainsail—Class D, 24ft. racing length and under.—To Old Orchard Shoal Light, to red bell buoy head of Swash Channel and return to starting line; 15 miles.

Class E, over 24ft. racing length.—To Old Orchard Shoal Light, to red bell buoy head of Swash Channel and return to starting line; 15 miles.

Sloops, Cutters and Yaws—25ft. class.—To Old Orchard Shoal Shoal Light, to red bell buoy head of Swash Channel and return to starting line; 15 miles.

Thirty-ft. Class.—To Old Orchard Shoal Light, to red buoy No. 12, perch and ball on top (S. W. Spit), and return to starting line; 18½ miles.

Thirty-five ft. Class.—To Old Orchard Shoal Light, to red buoy No. 12, perch and ball on top (S. W. Spit), and return to starting line; 18½ miles.

Forty-ft. Class, over 38ft. to 43ft. racing length.—To Old Orchard Shoal Light, to red buoy No. 12, perch and ball on top (S. W. Spit), and return to starting line; 18½ miles.

Many of the yachts of the club had been at the Atlantic Highlands over Sunday and were caught in the gale, some being badly damaged, so that only twenty were on hand for the regatta. There was no air on the Bay at noon and the race was not started until 1:15; a good south breeze came in then and made an exciting race. The times were:

40FT. CLASS—SLOOPS—18½ MILES.

The Iron steamboat Cygnus accompanied the yachts over the course.

The Training of Draftsmen and Designers.

THE following letter comes to us from the Pacific coast, touching on another phase of the shipbuilding industry. There can be no question that this country affords the most meager facilities to young men who desire to fit themselves for work of any kind in the shipyard, from designing downward. Those opportunities that exist in kindred occupations for the industrious beginner to steadily perfect himself are entirely lacking in the shipbuilding industry. The boy who goes into a shipyard as a learner and spends four years in squinting soda water on a boring tool for nominal wages is certain to find that his time has been wasted by his employer, and that he is no nearer to a knowledge of ship and engine building than before he saw the inside of some highly rated shipyard.

Editor Forest and Stream:

You make the statement that there are no American naval architects who have thus far turned out any steam yachts that can compare with English craft, but you do not state the reason why.

The reason is that no encouragement is given to an American to become a naval architect.

What chance is there for an ambitious young man to rise to a position of responsibility in our American shipyards, where every position of importance is given to foreign draftsmen, either English, Scotch, German or Scandinavian? If a native born American does get a show, it is only because he is a relative of some member of the firm.

It has been my observation that these firms who are hawling for protection to American labor—especially those of the Pacific coast, who expect Government contracts to be awarded to them at a higher price than their Eastern competitors, on account of an alleged higher cost of labor—generally run their yards as far as possible with a lot of apprentices who are paid \$3 and \$4 a week, and who are discharged at the end of their apprenticeship if they venture to ask for living wages, and their places filled with a new lot of apprentices who may expect a like fate.

What show is there in our navy yards (except with a good, strong pull), where American boys are given the very lowest rating, and all the first-class positions are held by Scandinavian and German draftsmen? In one case at a U. S. navy yard a German draftsman, rated second class as an engineer, was discharged and re-employed as a first-class ship draftsman, a trade he is entirely unfamiliar with; while the native born Americans in the same office, with eight and more years' experience as ship draftsmen, are refused promotion even when recommended by the chief naval constructor of the navy.

As for designing yachts, a Herreshoff would starve to death on the Pacific coast if he made yacht designing his specialty. The yachts out here are twenty and more years behind the times; the only yachtsmen with enterprise to pay for a design being George and Thomas Davidson, who built the cutter Folly from designs by the late Edward Burgess, and who were rewarded by seeing her beat everything in sight, even yachts in the larger classes. Yachtsmen on San Francisco Bay are perfectly contented with anything that the builder will whittle out for them, and as for paying for a design such a thing is not even dreamed of. Such is the Pacific coast. No doubt the rest of the country is just as bad.

W. B. C.

VALLEJO, Cal., June 2.

Canada.

MR. AMELIUS JARVIS has received a letter from the secretary of the International Yacht Association asking him what kind of a tender will be needed for the two big yachts, and offering to provide tenders also for the visiting fleet, the starting boats, etc. They also volunteer to secure hotel accommodation for the visitors. On the yacht tender meals will be provided for the two crews, and sleeping accommodation if necessary.

The new yacht Canada, destined for international honors, will sail its first race on June 27 on the Bay here, sailing for the Murray cup, and will enter after that in all races for which it will be eligible. Mr. Jarvis has chosen the following gentlemen, all amateur yachtsmen, from whom the crew of the Canada will be selected: Gerald Boulton, Thomas Plummer, W. H. Parsons, Sydney Small, George E. Evans, of Toronto; J. H. Fearsdale, of Hamilton; W. S. Clouston, Montreal; E. Bayly, Heber Phillips, Wilton Morse, and W. Moran, of Toronto. All of these are well known in yachting circles, and seven of them will be selected for the crew of the yacht, associated with Mr. Jarvis and the two professional sailors. There will be a good deal of hard work for them before the race is sailed. The crew will train on Lake Erie during the whole of August, taking part in all the regattas on the lake, commencing at Port Dover on the 3d, and continuing at Erie on the 6th and 7th. The race on the 7th will be a cruise one from Erie to Cleveland. During the week commencing on the 10th the yacht is due to sail in the races off Cleveland, where \$25,000 is offered in prizes. The week of the 17th will be spent at the regatta at Put-In-Bay, and the big race for championship honors will be sailed on the 24th, 25th and 26th at Toledo.—Toronto Evening Star.

Larchmont Y. C. Spring Regatta.

LARCHMONT—LONG ISLAND SOUND.
Saturday, June 20.

The spring regatta of the Larchmont Y. C. on Saturday brought out a wonderful fleet of starters for an event that is at best secondary to the club's annual regatta and has sometimes failed to call out more than a handful of boats. While the two special classes of the year, the 30ft. and the 15ft., did more than their share in swelling the entry list, at the same time the regular club classes were nearly all represented. Only through the will of the weather was the meeting of so many yachts, 60 in all, robbed of its interest. As only too frequently happens on the Sound in summer, there was a mere fiction of a breeze from S.W., enough to move even the bigger yachts at a fair pace at the start, with their kites all drawing, but very soon falling to almost a drift, and then to a flat calm. Toward the end of the first round the wind freshened, catching the most of the yachts off Hempstead Bay and hurrying them home; but then it fell light again, making the second round very slow and dull. There was nothing in the entire race that can be called conclusive or positive.

Outside of several new 15-footers making their debut in this race, the yachts were all well-known craft. The old Liris, after another chapter of her checkered career, having been run down by a coaster while at her winter moorings at Port Jefferson, her counter smashed off and the wreck sunk, was raised, has changed hands and been rebuilt by Wood & Son at City Island, making her reappearance in this race.

The regatta was under the rules of the Larchmont Y. C. and sailed over its new triangular courses, two rounds for each class. The start was advertised for 11:30, but the preparatory signal was not given until 12. It was a time start in nearly all classes, the 30 and 15-footers going from the gun. The arrangements were well carried out and the large fleet was timed successfully. The fleet of 60 yachts was sent off in 36 minutes from the first gun. The only trouble was a mix-up in which Emerald, Shamrock and Queen Mab were involved while working about the mouth of the harbor prior to the start, Emerald poking her bowsprit through Shamrock's mainsail and turning her completely around on top of Queen Mab. Shamrock finally crossed the line with a red flag in her rigging and a long tear just above the main boom near the clew. Just who, if either, was really to blame, must be decided by the committee.

In spite of all efforts, the centerboard of Colonia is still fast in her trunk, driven as far up as it will go and jammed so firmly that all efforts to clear it have failed. At the same time Vice-Com. Postley has been very anxious to race her, and started her on Saturday, as in the New York and Atlantic regattas, in spite of this handicap. Elsemarie was first over the line near the weather mark, Colonia following with balloon jibtopsail and balloon maintopmast staysail set; Wasp in the meanwhile crossing the leeward end of the line well clear of the big fellows. Emerald was handicapped, as were a number of others. The fleet crossed on starboard tack with balloon sails trimmed for an easy reach, the first leg of each course bearing to the eastward. Esperanza was the first of a group of four 30-footers that crossed nearly together on the weather end of the line. Hera went off alone and crossed just clear of the lee mark in a very good position.

The start of the 15-footers was by no means as sharp as it should have been. Paprika, sailed by L. B. Huntington, Jr., was first over the line, in company with Kittie and Hope. Ideal, sailed by W. Irvine Zerega and Geo. Clarke, was the last. Ten of them started in a bunch to windward, but one boat, a handsome little craft from Boston, El Heirie, sailed by her owners, Messrs. Crane, started on her own hook well to leeward of the fleet. She showed speed from the start in reaching, and in spite of the light wind was soon clear ahead. Paprika led the main division for a time, chased by Kittie. Hope came up after a few minutes, and when the fleet was left astern by the judges' boat El Heirie was leading, with Hope second, Kittie third and Paprika fourth. The rest of the race was invisible from the tug, but El Heirie continued to gain. On the windward leg Ideal, sailed in better trim than on the previous Saturday, worked out through the fleet to second place, holding it for the remainder of the race, with Gnome, the Herreshoff boat, third. Since her previous race Gnome has discarded the canoe mainsail given her by her builder and adopted the boom and gaff mainsail.

Only odd parts of the race of each class were visible at times; but the wind was so light and paltry that a detailed story, even if possible, would not be interesting. The thirties and the larger yachts came together at the Hempstead mark, the end of the second or windward leg of the first round, and the following times were taken:

Norota.....	3 18 46	Wawa.....	3 27 31
Esperanza.....	3 20 32	Vaquero III.....	3 28 44
Asahi.....	3 20 59	Colonia.....	3 25 45
Dragoon.....	3 23 10	Liris.....	3 36 39
Hera.....	3 24 54	Queen Mab.....	3 37 38
Mai.....	3 25 12	Wasp.....	3 38 18
Departure.....	3 25 22	Emerald.....	3 40 30
Caroline.....	3 27 02		

On the reach across to the line there was quite a lively breeze, and the fleet, large and small, made a fine sight, the thirties being specially smart and trim when under way. Colonia had done good work all day, increasing her lead of Emerald steadily, and she came across the Sound in fine style, with balloon jibtopsail and maintopmast staysail drawing. Immediately ahead of her were three or four smaller yachts, all of which turned the mark at the end of the round as per instructions, leaving all marks of the triangle on starboard hand. As she neared the line it became evident that she was paying no attention whatever to the markboat and its big blue and white ball, but was heading for the judges' tug and the second markboat at the outer end of the starting line. All of the small boats turned the right mark, but she kept off and rounded the tug, being hailed by the committee and informed of her mistake. She had then to turn both the wrong and afterward the right mark, describing in all a figure 8, and losing over 7 minutes' time. This brought her in just astern of Emerald, the two meeting as Emerald passed the mark on the right side and Colonia approached it to round. How such an error occurred is not clear, as other boats were visible rounding the proper mark at a distance of but a few yards. The times at the end of the first round were:

Norota.....	3 47 55	Hera.....	3 58 57
Dragoon.....	3 55 02	Mai.....	3 59 50
Uvira.....	3 57 34	Emerald.....	4 01 48
Asahi.....	3 57 42	Colonia.....	4 05 50
Esperanza.....	3 58 45		

The wind dropped just after the commencement of the second round, and the rest of the race was even more uninteresting than the first part, the mishap of Colonia spoiling the principal event of the day. Emerald increased her advantage, winning easily. Prior to the race Colonia was measured by Mr. Hyslop, coming out at 93.35ft. racing length. The official times are:

YACHTING NEWS NOTES.

Almy, steam yacht, Frederic Gallatin, arrived at Queenstown from New York on June 16.

The Norwalk Y. C. is a new organization, established last season at South Norwalk, Conn., where it has a comfortable house and good quarters. The officers are: Com., P. G. Sanford; Vice-Com., A. E. Chasmar; Treas., J. C. Green; Sec'y, H. S. Hatch; Ass't Sec'y, D. W. Raymond. The club offers excellent facilities to yachtsmen in the vicinity of South Norwalk; it has now a large membership.

Electra, steam yacht, when on her way from Wilmington to New York on June 11, lost her propeller and part of the tall shaft off Cape May and was taken in tow by the new steamboat Shinnecock and brought safely to New York. The yacht has a new stern and other alterations.

Margarita II, the new yacht designed by Watson for A. J. Drexel, of Philadelphia, was launched at Troon, Scotland, on June 14, being christened by Mrs. Watson, mother of the designer.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Sportshooting in the Fatherland.

SCHOENEGBERG, Berlin, May 28.—The championship tournament arranged by the Deutscher Jagd und Schiessklub proved quite a successful affair, both from a sportsmen's and a financial point of view.

Mr. Albert Preuss again won the championship for target shooting and holds this title for four consecutive years. He broke 141 targets out of a possible 150 at a distance of 28yds. from the traps. The next three highest guns were: Geyger, Miessner and Tenner. All four used Tatham's chilled shot, No. 7 trap.

Preuss also scored the highest number of points at the running wild boar target with his new Winchester take-down rifle, model 1894 and fitted up with Lyman's sights. Both his weapons, and especially Lyman's unexcelled sights, are much appreciated in this country, and will soon be in the hands of a great number of our crack riflemen.

ARMIN TENNER.

Rifle Notes.

A NUMBER of sportsmen who are interested in rifle and pistol shooting were to meet at the residence of Mr. L. O. Seidle, Sharpsburg, Pa., an evening of this week for the purpose of organizing a rifle and revolver club. The matter has been under consideration some time, and in anticipation of the organization a number of old shooters have already purchased rifles. Among those mentioned as being actively engaged in promoting the organization are: John Donnelly, L. O. Seidle, Dr. J. H. Silver, Joseph Holzheimer, Jacob Beck and William Patterson.

Rifle Club Constitutions.

We would be obliged if secretaries of rifle clubs would favor us with copies of constitutions and shooting rules, that we may send them to other clubs seeking such information.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

July 4.—SPRINGFIELD, N. J.—Annual tournament of the Union Gun Club; live birds and targets. E. D. Miller, Sec'y.

July 4.—PLEASANT HILL, Mo.—All-day shoot of the Pleasant Hill Gun Club.

July 4.—GREGORY'S POINT, Conn.—All-day shoot of the Naromake Gun Club. Targets. W. E. L. Capron, Sec'y.

July 21-22.—HOT SPRINGS, Ark.—Sixth annual meeting and tournament of the Arkansas State Sportsmen's Association; \$165 added money. All purses divided on equitable system. John J. Sumpter, Jr., Sec'y, Box 111, Hot Springs, Ark.

July 22-23.—PORTLAND, Me.—Interstate Association's tournament, under the auspices of the Portland Gun Club.

July 29-30.—WORCESTER, Mass.—A. W. Wall's tournament.

July 30, 31.—GOSHEN, Ind.—Midsummer tournament of the Goshen Gun Club.

Aug. 4-6.—CHICAGO, Ill.—Tournament of the Du Pont Smokeless Powder Company. E. S. Rice, Mgr.

Aug. 11-14.—DETROIT, Mich.—Jack Parker's sixth annual international tournament. Fuller details later.

Aug. 26-27.—BURLINGTON, Vt.—Tournament of the Interstate Association, under the auspices of the Lake Side Rod and Gun Club.

Sept. 2-4.—BUFFALO, N. Y.—Tournament at Audubon Park. Targets and live birds. B. F. Smith, Manager.

Oct. 7-9.—NEWBURGH, N. Y.—Annual fall tournament of the West Newburgh Gun and Rifle Association; targets and live birds; added money announced later.

October (second week).—BALTIMORE, Md.—Baltimore claims this week for her tournament. Dr. Samuel J. Fort, Sec'y.

1897.

March 23-25.—NEW YORK CITY.—The Interstate Association's fifth annual Grand American Handicap at live birds.

June (third week).—CLEVELAND, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

THE annual meeting of the Lynchburg Gun Club was held on June 13, and the following officers were elected for the ensuing year: President, Watkins L. Moorman; Vice-President, W. W. Dornin; Treasurer, C. W. Scott; Secretary, Geo. Fleming; First Captain, Thos. F. Nelson; Second Captain, Theo. F. Stearns. Mr. R. S. Terry retired from the presidency after having served seven years, and Mr. Nelson retired from the office of treasurer, which he had held for nine years.

The Massachusetts State Shooting Association held its seventeenth annual meeting at the Quincy House, Boston, on Wednesday evening, June 17, when the following officers were elected: President, Capt. E. B. Wadsworth; First Vice-President, W. L. Davis; Second Vice-President, David Breen Jr.; Secretary, O. R. Dickey; Treasurer, Thomas Howe. Directors: J. S. Sawyer, Dr. S. L. Judkins.

American Shots in England.

WE met Capt. Money last Monday, just back from England, and as was to be expected he had something to tell of trap affairs on the other side. This is the London international shooting week, and Capt. Money brought the programmes of the Gun Club and Hurlingham. The events called for are at the Gun Club, Notting Hill.

June 23, the Paris cup, value £50; handicap £5 stakes; afterward 28yds. £5 stakes; £25 cup. June 25, the Belgian cup, value £50; handicap £5 stakes; afterward 29yds. £5 stakes; £25 cup. June 27, the Gun Club international cup, value £100; handicap £5 stakes; afterward 30yds. £5 stakes; £25 cup.

The matches at Hurlingham are: June 22, a £50 cup; handicap, £5 stakes; afterward 29yds. £5 stakes; £25 cup. June 24, the Hurlingham £100 cup; handicap, £5 stakes; afterward 30yds. £5 stakes, for a gun. June 26, a £50 cup; handicap £5 stakes; afterward 29yds. £5 stakes; £25 cup.

The competitions are open to the Cercle des Patineurs, Paris; Tir aux Pigeons, Vienna; Tir aux Pigeons, Pesth; Bois de la Cambre, Brussels; Tiro Pichon, Madrid; International Club, Baden; Tir aux Pigeons, Florence; all the jockey clubs of Europe and America; the officers of the Army and Navy on full pay.

"How many Americans will be shooting," said Capt. Money, "I don't know, but when I left there were already there or intended to arrive from Paris and take part in it, George Work, Seaver Page, Yale and Charlie Dolan, Walter Watrous, Peter Morris and Jack Ellison. Walker Breeze Smith was in London when I arrived and said he was going to shoot, but returned to America a fortnight or more before me."

East Side Gun Club vs. Forester Gun Club.

NEWARK, N. J., June 20.—The first of a series of matches between these two clubs took place on the grounds of the former to-day. The East Side Gun Club is an old club which has drifted through many exigencies of management and is now perhaps on as good a basis as it ever was. The Forester Gun Club, on the contrary, is comparatively new and has been facetiously dubbed "the Swamp Angel" from the fact that its neat little club house is situated on the edge of the vast salt marsh which fringes Newark on that city's southern boundary. So that the soubriquet must not be taken as a slur, but rather a term of friendliness. Be that as it may, the Forester is a rattling good little club and up to date in nearly everything in the sporting line. The match with the East Side was hot, but at the end the older club came out ahead with the total of 112 to 106. The next match will be shot on July 11 on the Forester grounds. The final contest, if necessary, will be tossed for.

There were a few 10-target sweepstakes before and after the team race. The team race was at 25 targets per man.

The Pittsburg Shoot.

PITTSBURG, Pa., June 23.—Special to Forest and Stream: Pittsburg shoot should be successful, judging from the number of shooters in the city. Weather also looks favorable, although warm. Among the visitors are Messrs. Anthony and Todd, of Charlotte, N. C.; Redwing, Heikes, Raymond and Tippy, of Dayton; Norton, of Ironton, O.; Fulford, Fanning, Parmelee, Grimm, Budd, Powers, Sergeant, Appar, Winston, Thomas (of U. M. C. Co.), Seth Clover, Pope, Ralph Trimble, Arthur du Bray. The shoot is held at the Exposition Park, where Elmer Shaner has gotten everything in good shape. He, Old Hoss and Jim Crow have charge of the shoot. From present outlook, if locals turn out well, the 100-target handicap race shot to-day should have 50 entries.

EDWARD BANKS.

West Side Gun Club.

TOPEKA, KANS., June 17.—Scores of the last pigeon shoot of the West Side Gun Club are as follows: Conditions, 15 birds per man, 30yds. rise, A. S. A. rules, match for live-bird cup:

J C Clark.....	122012311210131-13	Tie.
J C Elliott.....	11212111111123-14	1121-5

H S Montgomery.....	11211112110212-14	1011-4
W Ryus.....	121201	-5

The following scores were made at targets: Clark 22, Morton 21, Biscoe 20, Montgomery 20, Ryus 16.

C. H. MORTON.

The Shreveport Gun Club's Programme.

THE Shreveport (La.) Rod and Gun Club has issued a programme for its tournament to be held July 2-4. The club will add \$300 to the purses. The tournament is open to amateurs only, professionals being barred.

The programme for each day calls for 10 events of 20 targets, unknown angles, \$250 entrance, \$7.50 added to each purse. As average money for shooters who go through the programme, the club will give \$20 to the 1st, \$17.50 to the 2d, \$15 to the 3d, \$12.50 to 4th, \$10 to 5th, and a 10lb. drum of Schultze powder (presented by Von Lengerke & Detmold) to the 6th average. All purses are divided into 4 moneys.

The Syracuse Shooting Tournament.

MR. ARTHUR JENKINS, of the Syracuse, N. Y., Herald, has announced a "national shooting tournament and festival" for the week of June 29-July 4. The shoot, which is for shotguns, rifles and pistols, will be held in the State Fair Grounds. Four sets of 5 traps each will be in position for the shotgun men, while there will be two ranges each for the riflemen and the devotees of the pistol. Live birds will be shot on Saturday, the contests under this head being held under the auspices of the Onondaga County Sportsmen's Club.

Massachusetts State Shooting Association.

WELLINGTON, Mass., June 17.—The seventeenth annual shoot of the Massachusetts State Shooting Association was held under the auspices of the Boston Shooting Association at Wellington to-day. The principal events were the three-men team race and the individual shoot for the Association's prizes. The scores:

Individual shoot for Association's prizes, 20 targets per man: Martin 19, Rule 14, Howe 17, Puck 15, Snow 13, Davis 12, Kennerson 17, Mason 12, Henderson 17, Stevens 11, Jones 13, Herbert 14, Hastings 13, Allison 12, Willis 12, Brown 15, White 18, Winn 15, Burton 10, Fox 10, Bradley 11, Hanson 13, Spaulding 14, Le Roy 18, King 15.

Three-men team shoot, 10 targets per man: Dedham team: Herbert 8, Jones 10, White 9. Total 27.

New Jersey 'Trap-Shooters' League.

SPRINGFIELD, N. J., June 16.—It was the fifth monthly meeting of this organization which took place at the grounds of the Union Gun Club to-day. The weather in the early morning was threatening, which accounts for the poor attendance, but those who put in an appearance were more than satisfied with the day's sport, the last of them leaving to catch a train long after 6 o'clock. Enoch Miller was of course on hand and was ably assisted in the office by the League's secretary, Mr. Hobart. Discouraged by the rain which the early morning hours forewarned, only three teams put in an appearance. Dunellen, the youngest member of the League; the South Sides, of Newark, and the home team, the Union Gun Club. Previous to and following the main event, seventeen sweepstakes were shot, all under the known trap, and unknown angle rule, with the exception of No. 14, which was expert. No. 17 was miss-and-out. The scores:

Union Gun Club: E. D. Miller 24, W. Sigler 23, R. S. Williams 21, A. A. Woodruff 19, Dutchy Smith 18, Dr. T. J. Jackson 16; total 121.

South Side Gun Club: E. A. Geoffroy 22, C. M. Hedden 19, J. H. Dawson 19, M. Herrington 19, W. R. Hobart 19, R. H. Breintnall 17; total 115.

Dunellen Gun Club: T. H. Brantingham 21, A. Gray 20, P. Osborne 18, Henry Lindzey 16, Charles Giles 14, A. G. Smith 9; total 98

W. R. HOBART, Sec'y.

The Chamberlin Third Annual.
PAUL NORTH AND HIS NOVELTY STORE.

The third annual tournament of the Chamberlin Cartridge and Target Company, which closed at Cleveland, O., on June 19, after three consecutive days of shooting, deserves a good deal more space in the trap columns of FOREST AND STREAM than it is possible to give up to it. If the entries did not run as high as in past years, the list of shooters taking part shows a really excellent attendance, when one takes into consideration the number of big shoots that have been following one another in rapid succession for a period of nearly three months.

The most remarkable feature about this shoot was the number of novelties introduced into the programme by Paul North. In the first place the Chamberlin Company threw all

BLUEROCKS FREE OF CHARGE.

This was an idea that really startled shooters when they first glanced through the programme issued by the company in the early part of this year. We must own to being taken aback by the boldness of the scheme and asked Paul North his idea in making no charge for targets. His answer was to the effect that at past tournaments given by the company it had been more than hinted that, instead of being out of pocket by the shoot, the company had made money by the sale of targets, notwithstanding the large amount of added money given away and the expenses of running a large tournament. "If we throw targets free of charge," said he, "they can't say that we are making any money."

The scheme took with the shooters naturally. All 15-target events were \$3 entrance, 5 moneys, nothing out for targets, and with \$35 cash added to the purses. The added money was donated by the following manufacturers and dealers, and amounted to \$770: Du Pont Powder Co., Hazard Powder Co., Von Langerke & Detmold, Winchester Repeating Arms Co., Lefever Arms Co., Syracuse Arms Co., Laflin & Rand Powder Co., Parker Bros., Hunter Arms Co., American Smokeless Powder Co., King Powder Co. and the American E. C. Powder Co. In all extra events shot off at the conclusion of each day's programme targets were also thrown free of charge.

Then again, the trial of

JUDGE LINDSAY'S HANDICAP

was another special feature of this shoot that attracted a great deal of attention. The system advocated by Judge Lindsay, of Knoxville, Tenn., is best described by the words of the programme touching on that point:

"Judge Lindsay's Handicap is also a new departure, which we feel confident will meet the approval of both amateur and expert. The handicap is as follows: In first event all pay \$3 entrance. In second event winners of first money in first event pay \$4, winners of second \$3.50, winners of third \$3, winners of fourth \$2.50, and winners of fifth and those that do not get a place \$2 entrance. Each event being handicapped by scores made in preceding event."

As regards the working of this system, we think it is safe to say that it was a success, and undoubtedly kept many men shooting who would otherwise have quit early in the game. It unquestionably reduces to a certain extent the winnings of the crackerjacks, while it also reduces the losses of the poorer shots. It is perhaps a little difficult for a cashier's department to pay the winners in the various events as promptly as under the usual system; but at Cleveland after the first day—that is, when once the officials in the cashier's office became more familiar with the workings of the system—there was very little, if any, delay in paying out each event. We may add, too, in favor of the Lindsay Handicap, that, so far as we recollect, we did not hear a single kick registered against it.

But the main feature of the tournament was

THE DEBUT OF THE MAGAUTRAP.

For the first time in the history of target shooting, a tournament, and a crackerjack tournament at that, was run with "magazine automatic traps." In the magautrap Paul North has a machine that is apparently bound to revolutionize trap-shooting to a great extent. It was put to a hard test during those three days at Cleveland, but it came out of the test not only unscathed, but with credentials of an extremely flattering nature. It has its drawbacks, perhaps, but its

PAUL NORTH AND THE MAGAUTRAP.

advantages for known or unknown angles over the 5 trap system far outweigh its disadvantages. For expert rule shooting it is not in it, all the targets starting from a common center; while for pairs there is a slight, but still appreciable, interval of time between the discharge of the first and second targets; as, however, it is the same for everybody, the use of the magautrap for pairs may be adopted.

For unknown angles, however, it is as nearly perfect as it can be. One gets a greater variety of angles and they are absolutely unknown, not being dependent upon the usual rhythmical swing of the ordinary trapper-boy—right quarterer, straightaway, left quarterer, straightaway, right quarterer, etc., etc. Instead of the shooters standing at the score in a straight line, a segment of a circle with a radius of 16yds. is described, the positions for Nos. 1, 2, 3, 4 and 5 shooters being marked off on this segment of a circle at equal distances of 5yds. between each man. The magautrap is located in the center of the circle and throws targets within the limits of angles permitted by the A. S. A. rules. When at No. 3 the shooter gets the ordinary angles; he then moves on to No. 4, where he gets more targets with a right quartering tendency than any other kind; at No. 5 he gets some stinging right quarterers mixed in with occasional straightaways; passing to No. 1, he is treated just the opposite to what he got at No. 5; sharp left quarterers and a few straightaways are his lot at No. 1, while at No. 2 he gets left quartering targets in place of the right quartering targets which fall to his lot when at No. 4. Take a pencil and a piece of paper, draw the score and the trap with its angles and figure this thing out for yourself.

To obviate the necessity of moving after every shot, and consequently the need of a pivot man, Paul North introduced another novelty. In 15-target events all the shooters fired at 3 targets, rapid-firing system, before moving on to their next positions; in 20-target events 4 shots were fired by each man before a move was made, and in 25-target races 5 shots were fired from each position. No. 1 man in the squad, therefore, just worked his way up to No. 5 score, finishing his string with the last shot from that mark. This was a little confusing at first, but the boys soon got used to it, and there is no question that with this scheme at work, aided by a magautrap, extremely rapid squad work can be done. At this shoot squads of 5 men were shot, not 6, as is customary.

The only fault that could possibly be found with the working of the two magautraps used at this tournament was the interval of time that elapsed between calling "Pull!" and the appearance of the target in the air. This interval was by no means so noticeable on the last two days of the shoot as it was at first. There was also some delay at times owing to broken targets clogging the machine. Still there can be no two opinions as to the thorough success of the debut of the magautrap.

BATTUE SHOOTING.

Two or three times during the tournament Paul North called up a score or more of shooters, the shooting platform being crowded from end to end with men with guns and shells. He then informed them that he would throw targets fast enough to keep them all busy. Anxious to see the magautrap worked at high pressure, we went into the pit alongside the machine. There was the magautrap with its power generated by "the man on the bicycle," he was surrounded by plenty

of bluerocks ready to be placed in the feeder; the puller, of course, was behind the score in rear of the shooters. Then the fun began. The "bicycle rider" churned for dear life while Paul at the pulling apparatus sent targets into the air until it was full of bluerocks. The rattle of musketry was deafening, and out of the 100 or more targets thrown in this bout about one-half went to grass uninjured. A second bout was tried with the same result.

There was one feature in this "battue shooting" that specially attracted our attention: There seemed far less breakage of targets than when a squad was at work. We took the trouble to look for broken targets in both bouts; in the first (the longest too) we saw but one target broken by the trap; in the second we counted just 4 of them!

THE MANAGER AND HIS STAFF.

The sole charge and management of the tournament was, of course, placed in the hands of Paul North. For his staff he chose the following: Cashier's office: J. H. Webster, paying teller: J. E. Brocklesby and D. S. Mitchell, entry clerks. Referees: John Wellington and R. J. Bissett. Scorers: John Wightman, C. M. Roof, J. E. Jones and Chas. North.

The programme arranged for each day as by no means lengthy, and the boys were there to shoot. As a natural result the number of all-day entries was large, and the work of keeping things moving and the squads intact was proportionately easy. The tournament was smoothly run from start to finish.

THE SHOOTERS, THEIR GUNS, SHELLS AND POWDERS.

Ohio showed up very strongly, being very largely represented at the traps. A notable absentee was Charlie Young; it seemed strange to be at a tournament in Ohio without Charlie. The attendance, though not as large as last year, was still decidedly good, and the tournament must be classed as a highly satisfactory one. Below we give a table showing who was there, and the guns, shells and powders used:

GENERAL AVERAGES.

The three days' programme called for 330 targets, 110 targets per day. These were divided into 4 events of 15 targets each, and one event of 50 targets; the latter was divided into optional sweeps of \$2 on each 25. Each of these 50-target events was a special event, the use of a certain powder being compulsory in each one. On June 17 it was the Du Pont event; on June 18, Hazard event, and on June 19, Schultze event; Du Pont, Hazard and Schultze being used on the above respective dates. The Du Pont company, Hazard company and Von Langerke & Detmold, American agents of Schultze powder, each donated a diamond watch charm as first prize in their respective events; entrance was only the price of the cartridges—\$1.50.

Forty-one shooters shot through the programme. Fulford, although apparently out of the race after the first day, finished very strongly, losing only 10 targets out of his last 220 and landing in first place by one target, thus securing the \$50 diamond watch charm offered for first average. Below is a list of the above 41 shooters:

	Broke.	Av.		Broke.	Av.

FIRST DAY, JUNE 17.

The weather was all that could be desired and Paul North had nothing to complain about in that respect. The boys found the work of the magautrap a little deceiving, and as a natural result scores were considerably lower than usual. Glover led with a percentage of 92.7, Heikes being one target behind him with a percentage of 91.8. Event No. 4 was the Du Pont event, 50 targets, unknown angles, contestants to use Chamberlin cartridges loaded with Du Pont Smokeless. Fulford won the diamond watch charm with 47 out of 50, Heikes being second with 46. Altogether 87 shooters took part in the programme events, a very satisfactory total when one considers how much shooting there has been of late. Below is a table showing the

SCORES OF JUNE 17.

The following shot in only one event:
No. 1: Porter 9; No. 2: Jones 5; No. 3: Mack; No. 4: North 38, Holt 37, Muller 31.

THIRD DAY, JUNE 19.
Another lovely day; hotter, perhaps, than either of its two predecessors, but still a good day for target-shooting. Fulford again did great work, losing only 4 targets out of 110 shot at, and leading the rest of the shooters with a percentage of 96.2. McMurry, who had recovered somewhat from his indisposition, shot well, tying Alkire and Redwing for third place, besides winning the diamond watch charm offered by Von Lengerke & Delmow for the highest score in No. 4, the Schultze powder contest. Below is the table of the

Events:	1	2	3	4	5	Shot at.	Broke.	Av.

EDWARD BANKS.

New Utrecht Gun Club.

WOODLAWN, L. I., June 20.—The New Utrecht Gun Club's last live-bird shoot of the season was held here to-day. In the club shoot Morley and Lau tied for the Class A prize with 10 kills each, and shot off in the next event, in which they again tied. Morley finally won after killing 21 straight. J. U. Meyer captured the Class B medal. Scores:
